Contents

CHAPTER		PAGE
1	EMPIRICAL BACKGROUND	1
1.1	Random experiments and random variables	1
1.2	Finite families of random variables	3
1.3	Infinite families—stochastic processes	3
1.4	The probabilistic structure of a stochastic process	7
1.5	Generalizations	9
2	SOME FUNDAMENTAL CONCEPTS AND RESULTS OF MATHEMATICAL PROBABILITY THEORY	12
2.1	Random experiments. Fields of events	12
2.2	Events and sets. Fields and σ-fields	14
2.3	Probability measure and its extensions	16
2.4	Probability spaces	17
2.5	Random variables	18
2.6	Conditional probability. Independence	20
2.7	Characteristic functions. Convergence of distributions	21
2.8	Sequences of events and of random variables	23
2.9	σ-fields generated by random variables	24
2.10	The normal distribution	24
3	FOUNDATIONS OF THE THEORY OF STOCHASTIC PROCESSES	28
3.1	Families of random variables	28
3.2	Sample functions	30
3.3	The Kolmogorov theorem	32

3.4 Real-valued parameter. The discrete case 37
3.5 Convergence of sequences of random variables . . . 39
3.6 Real-valued parameter. The continuous case . . . 44
3.7 The Poisson process 49
3.8 Stationary streams of events 52
3.9 Examples of stochastic processes 58

4 ANALYTICAL PROPERTIES OF SAMPLE FUNCTIONS 62

4.1 Preliminary remarks 62
4.2 Sample function continuity 63
4.3 Sample function differentiability 67
4.4 Questions related to continuity 70
4.5 Tangencies and crossings of a level 75

5 PROCESSES WITH FINITE SECOND-ORDER MOMENTS 79

5.1 The mean and covariance functions. 79
5.2 Continuity and differentiability in quadratic mean . . 82
5.3 Stochastic integrals in q.m. 85
5.4 Analytical properties of sample functions. 88
5.5 Ergodic theorems 92
5.6 Hilbert space and random variables 96
5.7 Linear least-squares prediction 104

6 PROCESSES WITH ORTHOGONAL INCREMENTS 109

6.1 Generalities. Continuity in q.m. 109
6.2 Sample function continuity 112
6.3 Stochastic integrals 113
6.4 Fourier integrals 115
6.5 Processes with independent increments 118

7 STATIONARY PROCESSES 120

7.1 Stationary and strictly stationary processes . . . 120
7.2 The covariance function. 123
7.3 Analytical properties of sample functions. 125
7.4 Bochner's theorem 126
7.5 The spectral representation 128
7.6 The real-valued case 135
7.7 The discrete-time case 137
7.8 Linear operations on stationary processes . . . 138
7.9 Prediction 143

7.10 Ergodic theorems. Stationary processes 147
7.11 Ergodic theorems. Strictly stationary processes . . . 148

8 GENERALIZATIONS 160

8.1 Stationary vector processes 160
8.2 Processes with stationary increments 163
8.3 Harmonizable processes. 166
8.4 Homogeneous random fields 167

9 ANALYTICAL PROPERTIES OF THE SAMPLE FUNCTIONS OF NORMAL PROCESSES. 169

9.1 Preliminary remarks 169
9.2 Stationary normal processes 170
9.3 Conditions on covariance function and spectrum . . 174
9.4 Nonstationary normal processes 183
9.5 Further results 187

10 "CROSSING" PROBLEMS AND RELATED TOPICS 190

10.1 Background and notation 190
10.2 Crossings, upcrossings, and downcrossings . . . 191
10.3 Crossing of a level—mean number in time T . . . 193
10.4 Tangencies, and the means of N_u, U_u, D_u . . . 197
10.5 Crossings as stationary streams 200
10.6 Higher moments of C_u, U_u, D_u 202
10.7 The variance of the number of zeros 209
10.8 Time spent above a level; Z_n-exceedance measures . . 212

11 PROPERTIES OF STREAMS OF CROSSINGS 219

11.1 Conditional distributions 219
11.2 Excursions, and intervals between crossings . . . 222
11.3 Higher-order distributions 229
11.4 Crossing intervals containing a fixed point . . . 234
11.5 Ergodic theorems 237
11.6 Local maxima of strictly stationary processes . . . 242
11.7 The envelope of a stationary process 248
11.8 Level crossings by the envelope. Fades 252

12 LIMIT THEOREMS FOR CROSSINGS 256

12.1 Introduction. 256
12.2 Asymptotic Poisson character of the stream of upcrossings 257

12.3 Limiting distribution of extreme values 271
12.4 Intervals between upcrossings 272
12.5 Length of an excursion above a high level . . . 274
12.6 Length of a fade below a small level 279
12.7 The discrete-time case 281

13 NONSTATIONARY NORMAL PROCESSES. CURVE CROSSING PROBLEMS 283

13.1 Curve crossings and nonstationarity 283
13.2 Mean number of curve crossings 284
13.3 Upcrossings, downcrossings, tangencies, and zeros . . 288
13.4 Exceedance measures 291
13.5 Extreme values of certain nonstationary normal processes . 294

14 FREQUENCY DETECTION AND RELATED TOPICS 299

14.1 Introductory remarks 299
14.2 Envelope, phase, and frequency 300
14.3 Noise in frequency modulation receivers 306
14.4 Sine waves in random noise 314
14.5 Frequency measurements 320

15 SOME ASPECTS OF THE RELIABILITY OF LINEAR SYSTEMS 324

15.1 Background 324
15.2 Spectral analysis of linear systems 326
15.3 Application to a simple guidance system 331
