

The Calculation of Model Stellar Atmospheres

DIMITRI MIHALAS

PRINCETON UNIVERSITY OBSERVATORY
PRINCETON, NEW JERSEY

I. Introduction	1
II. Basic Equations and Assumptions	3
A. The Atmospheres Are Plane-Parallel	3
B. The Atmospheres Are in Hydrostatic Equilibrium	5
C. The Atmosphere Is Assumed To Be in Energy Equilibrium	6
D. LTE Is Presumed To Prevail	7
III. Physical and Thermodynamic Variables	7
A. Excitation and Ionization	7
B. Molecular Dissociation	8
C. The Gas Pressure	9
D. Density	15
E. Specific Heats and Adiabatic Gradients	16
F. The Continuous Opacity	19
IV. Integration of the Pressure Equation	24
A. Integration Formulas	24
B. Finding the Starting Value	25
C. Continuing the Integration	26
D. The Other Physical Variables	26
V. Solution of the Transfer Equation	27
A. Solution of the Milne–Eddington Equation	27
B. Quadrature Formulas for Integrals Weighted by $E_n(x)$	30
VI. Determining the Temperature Distribution	34
VII. Line-Blanketing Effects	40
VIII. Convection	43
IX. Prospects	49
References	51

Computational Methods for Non-LTE Line-Transfer Problems

D. G. HUMMER¹

DEPARTMENT OF PHYSICS
UNIVERSITY COLLEGE, LONDON, ENGLAND

G. RYBICKI

SMITHSONIAN ASTROPHYSICAL OBSERVATORY, SMITHSONIAN INSTITUTION
CAMBRIDGE, MASSACHUSETTS

I. Introduction	53
II. Summary of Basic Physical Theory	55
III. Constant Property Media	62
A. The Discrete Ordinate Method	64
B. The Kernel Approximation Method	80
C. Green's Functions and Resolvents	86
IV. Variable Property Media: The Limited Case	89
A. Quadrature Methods	90
B. Neumann Series	97
C. Expansion Methods	100
V. Methods Using Differential Equations	106
A. General Matrix Form of the Equations	107
B. Superposition of Solutions	111
C. The Generalized Riccati Transformation	115
D. Discretization Methods	120
Appendix . Chebyshev Expansion of $K_1(\tau)$ for Doppler Broadening	123
References	126

Methods for Calculating Stellar Evolution

R. KIPPENHAHN and A. WEIGERT

UNIVERSITÄTSSTERNWARTE
GÖTTINGEN, GERMANY

EMMI HOFMEISTER¹

MAX-PLANCK-INSTITUT FÜR PHYSIK UND ASTROPHYSIK
MÜNCHEN, GERMANY

I. Introduction.....	129
II. Formulation of the Problem.....	130
A. The Equations of Stellar Evolution.....	130
B. The Initial Value Problem.....	137
III. Method of Solution.....	140
A. Difference Equations.....	140
B. Solution of the Difference Equations.....	145
C. Outline of the Entire Program.....	153
IV. Programming Details.....	155
A. Outer Layer Integration Strategy.....	155
B. Stepwidths.....	161
C. Starting an Evolutionary Sequence.....	166
D. Convergence Improvements.....	169
E. Properties of Stellar Matter.....	173
F. Change of the Chemical Composition.....	182
G. Computing Time, Storage, Accuracy.....	186
Nomenclature.....	188
References.....	190

Computational Methods in Stellar Pulsation¹

R. F. CHRISTY

CALIFORNIA INSTITUTE OF TECHNOLOGY
PASADENA, CALIFORNIA

I. Introduction	191
II. Physical Properties of the Materials	193
III. Equations	194
IV. Boundary Conditions	195
V. The Outer Boundary	196
VI. The Static Model	197
VII. The Nonlinear Pulsation Problem	199
VIII. The Difference Equations for Dynamics	200
