

CONTENTS

Chapter 1 Basic Concepts of Analysis

1.1	Sets and functions	1
1.2	Topologies	4
1.3	Metric spaces	8
1.4	Compactness	11
1.5	Real functionals	15
1.6	Measurability	16
1.7	Connectedness	18
1.8	Notation	18

Chapter 2 Linear and Multilinear Algebra

2.1	Vector spaces and linear operators	22
2.2	Examples of infinite-dimensional spaces	36
2.3	Linear functionals and multilinear mappings	38

Chapter 3 Topological Vector Spaces

3.0	Introduction and guide to Chapter 3	48
3.1	Topologies and norms	48
3.2	Normed vector spaces	51
3.3	Pre-Hilbert (inner product) spaces	55
3.4	Convexity in topological vector spaces	62
3.5	Metric properties of linear operators on normed spaces	62
	The conjugate of a normed space	69
	The adjoint of a continuous linear operator	71
3.6	The spectrum of a linear operator; eigenvalues	73
3.7	Convergence of operators	84

Chapter 4 Numerical Solution of Linear Algebraic Systems

4.1	Introduction	102
4.2	Gaussian elimination with real numbers	104
	Gaussian elimination with finite-precision numbers	
4.3	Estimates of error in Gaussian elimination	113
4.4	Iterative methods	123
	Iteration on the residuals	123
	Jacobi iteration	129
	Diagonal dominance and irreducible matrices	136
	The self-adjoint case	143
4.5	Relaxation methods, acceleration of convergence	145
4.6	Solution of singular linear systems; the pseudo inverse	153

Chapter 5	Solution of Nonlinear Equations	
5.1	Fixed points and contractive mappings	164
	Computational aspects (rounding errors, rates of convergence)	170
	Stability of successive approximations	172
5.2	Newton's method—the one-dimensional case	174
5.3	Differential calculus of vector functions	178
	Higher order-derivatives and differentials	189
	Partial differentiation	194
5.4	Newton's method for vector functions	195
5.5	Modifications of Newton's method	199
5.6	Zeros of polynomials in one variable	208
	Sturm sequences	209
	Bernoulli's method	210
	Bairstow's method	211
	Error analysis	212
5.7	Acceleration of convergence of sequences	213
5.8	Rates of convergence	215
Chapter 6	The Computation of Matrix Eigenvalues and Eigenvectors	
6.1	Introduction	230
6.2	Error estimates	231
6.3	The power method	238
6.4	The Jacobi method (for a symmetric matrix)	240
	Rate of convergence	243
	Error analysis	244
6.5	Householder's method	245
6.6	Givens' method (eigenvalues of a symmetric tridiagonal matrix)	247
6.7	Eigenvectors of a symmetric tridiagonal matrix	250
6.8	Eigenvalues of an arbitrary matrix by reduction to upper Hessenberg form	250
6.9	The <i>QR</i> Algorithm (for reduction of a matrix to triangular form by similarity transformations)	251
6.10	External properties of eigenvalues	256
6.11	Singular values and the pseudo inverse	257
Chapter 7	Approximation Theory	
7.1	Introduction	265
7.2	The Weierstrass theorem (1885)	266
7.3	Closest approximation in normed and seminormed spaces	269
7.4	Closest least-squares approximation in pre-Hilbert spaces	276
7.5	Polynomial approximation in the uniform norm	280
7.6	Generalized polynomial approximation in the uniform norm	290
7.7	Least squares approximation of functions of a real variable; orthogonal families of polynomials	293
7.8	Orthogonal polynomials as eigenfunctions	309
7.9	Rational approximation	311
7.10	Multivariate approximation	319
7.11	Mathematical programming techniques	321

Chapter 8 Interpolation

8.1	The general interpolation problem	335
8.2	Other forms of the interpolating polynomial	339
8.3	The error in polynomial interpolation	345
8.4	Numerical differentiation	353
8.5	Spline functions	355
8.6	Inverse interpolation	360
8.7	Trigonometric interpolation	363
8.8	Curve-fitting and smoothing of data	365

Chapter 9 Numerical Integration

9.1	Introduction	380
9.2	Linear quadrature functionals	381
9.3	Composite quadrature functionals	388
9.4	Gaussian quadrature	392
	Gaussian quadrature with assigned nodes	395
9.5	Integration over infinite intervals, singular integrals	403
9.6	Integration of periodic functions	406
9.7	Extrapolation to the limit; Romberg integration	408
9.8	Quadrature functionals with minimum remainder	411
9.9	Multiple integrals	416

Chapter 10 Numerical Solution of Ordinary Differential Equations

10.1	Introduction; differential equations and difference equations	431
10.2	Numerical solution by numerical quadrature	439
10.3	Error analysis and convergence of quadrature methods	444
10.4	Rounding errors in quadrature methods	447
10.5	One-step methods	450
10.6	Stability of numerical solutions by difference methods	464
10.7	Stiff equations and A -stability	475

Chapter 11 Boundary-Value Problems for Differential Equations

11.1	Existence and uniqueness of exact solutions	489
11.2	Solution of boundary-value problems by iteration on the initial values	502
11.3	Difference methods	507
11.4	Linear boundary-value problems, eigenvalue problems and variational methods	510
11.5	The Bubnov-Galerkin method	512
11.6	Boundary-value problems for partial differential equations	513

Chapter 12 Extremum Problems

12.1	Introduction	520
12.2	Extremum problems with equality constraints	523
12.3	Gradient methods for extremum problems without constraints	534
12.4	Gradient methods for extremum problems with equality constraints	546
12.5	The eigenvalue problem for a self-adjoint operator	552
12.6	Computational solution of the optimal control problem of Mayer by gradient techniques	559

12.7	The Rayleigh-Ritz method	565
12.8	Linear programming	571
12.9	Inequality constraints, mathematical nonlinear programming	577
12.10	Penalty function techniques (sequential unconstrained methods)	582
Appendix I	Proof of convergence of Galerkin's method	590
Appendix II	The Hahn-Banach theorem	592
Appendix III	The Stone-Weierstrass theorem	594
Appendix IV	The implicit-function theorem	596
Appendix V	Results on the spectrum of linear operators	599
Appendix VI	Proof of fundamental theorem of linear programming	602
Index		605
