

Table of Contents

Chapter 1. Introduction

1. Series Expansions	1
2. Choice of Basis Functions	2
3. Comparison with Finite Element Methods	3
4. Boundary Conditions	5
5. The Two Kingdoms: Non-Interpolating and Pseudospectral Families of Methods	7
6. Accuracy and Efficiency	10
7. Examples	12

Chapter 2. Convergence Theory

1. Introduction	20
2. Fourier Series	23
3. Orders of Convergence	29
4. An Upper Bound on the Truncation Error	33
5. Integration-By-Parts-Bound on Fourier Coefficients	37
6. Asymptotic Calculation of Coefficients: Power Series ..	44
7. Asymptotic Calculation of Coefficients: Fourier Series.	50
8. Model Functions for Fourier Series	55
9. Convergence Theory for Chebyshev Polynomials	62
10. Algebraically-Converging Chebyshev Series: Functions with Singularities at the Endpoints	69
11. Summary	70

Chapter 3. Galerkin's Method & Inner Products

1. Mean Weighted Residual Methods	79
2. General Properties of Basis Functions: Completeness ...	84
3. Properties of Basis Functions: Inner Product & Orthogonality	87
4. Galerkin's Method	91
5. Galerkin's Method: Case Studies	94
6. Galerkin's Method & Separation of Variables	102
7. Galerkin's in Quantum Theory: Heisenberg Matrix Mechanics	104
8. Galerkin's Method Today	109

Chapter 4. Interpolation, Collocation & All That

1. Introduction	115
2. Polynomial Interpolation	116
3. Gaussian Integration & Pseudospectral Grids	122
4. Pseudospectral: Galerkin's Method via Gaussian Quadrature	126
5. Pseudospectral Errors for Trigonometric & Chebyshev Polynomials	134
6. The Envelope of the Interpolation Error	141

Chapter 5. Cardinal Functions

1. Introduction	166
2. Whittaker Cardinal or "Sinc" Functions	167
3. Cardinal Functions for Trigonometric Interpolation	169
4. Cardinal Functions for Orthogonal Polynomials	174
5. Transformations and Interpolation	175

Chapter 6. Pseudospectral Methods for Boundary Value Problems

1. Introduction	182
2. Choice of Basis Set	182
3. Boundary Conditions: Behavioral & Numerical	183
4. "Boundary-Bordering" for "Numerical" Boundary Conditions	185
5. "Basis Recombination" & "Homogenization of Boundary Conditions"	188
6. The Cardinal Function Basis	193
7. The Interpolation Grid	195
8. Computing the Basis Functions & Their Derivatives	196
9. Special Problems of Higher Dimensions: Indexing	199
10. Special Problems of Higher Dimensions: Boundary Conditions, Singular Matrices & Over-Determined	202
11. Special Problems in Higher Dimensions: Corner Singularities	203
12. Matrix Methods	205
13. Checking	205
14. Summary	207
Table 6-1. A Sample FORTRAN Program for Solving a Two-Point Boundary Value Problem	209

Chapter 7. Symmetry & Parity

1. Introduction	213
2. Parity	213
3. Other Discrete Symmetries	220
4. Apple-Slicing, Axisymmetric & Hemispheric Models	223
5. Continuous Symmetries	225
Table 7-1. Symmetry Classes for Trigonometric Functions	231

Chapter 8. Explicit Time-Integration Methods

1. Introduction	236
2. Differential Equations with Variable Coefficients	238
3. Linear and Nonlinear	242

Chapter 9. Practical Matters

1. Introduction	245
2. Partial Summation in Two or More Dimensions	246
3. The Fast Fourier Transform	250
4. Rules-of-Thumb	256
5. Boundary Layers	263
6. Endpoint versus Interior Singularities	266
7. Aliasing and the 3/2's Rule	268
Table 9-1. RMS errors for the One-Dimensional Wave Equation	277

Chapter 10. "Fractional Steps" Time Integration: Splitting and Its Cousins

1. Introduction	283
2. Diffusion Equation: Analytical and Numerical Background	283
3. The Method of Fractional Steps for the Diffusion Equ...	290
4. Pitfalls in Splitting: Boundary Conditions & Consistency	292
5. Operator Theory of Time-Stepping Methods	295
6. Splitting the Navier-Stokes Equation	301

7. Rigid Boundaries, Incompressible Flow, and Splitting, I: The Over-Specified Pressure-Poisson Equation	302
8. Rigid Boundaries, Incompressible Flow, and Splitting, II: "Parabolic" & "Elliptic" Schemes & Numerical Boundary Layers	304
9. Rigid Boundaries, Incompressible Flow, and Splitting, III: Fractional Step-Coupling Boundary Conditions ...	307
10. Summary	312
Chapter 11. Case Studies of Time Integration	
1. Introduction	315
2. Three-Dimensional Periodic Turbulence: Brachet	315
3. Stellar Convection in Annular Shell: Glatzmaier	317
4. Plasma Physics in a Torus (Fusion Reactor): Schnack ...	320
5. Plane Poiseuille and Couette Flow: Orszag & Kells	324
6. Splitting & Separable Operators: Pipe Poiseuille Flow .	329
7. Complex Geometry and Variable Coefficients: Zang	330
Chapter 12. Iterative Methods for Solving Matrix Equations	
1. Introduction	337
2. Stationary One-Step Iterations & the Richardson/Euler Iteration	338
3. Chebyshev Acceleration	345
4. Pre-conditioning: Finite Difference	350
5. Computing the Iterates: FFT & Matrix Multiplication ...	357
6. Alternative Pre-Conditionings for Partial Differential Equations	359
7. Multigrid: An Overview	361
8. The Minimum Residual Richardson's (MRR) Method	365
9. The Delves-Freeman "Asymptotically Diagonal" Preconditioned Iteration	370
10. Direct Methods for Separable PDE's	376
11. Recursion & Formal Integration: Clenshaw's Algorithm..	380
12. Positive Definite & Indefinite Pseudospectral Matrices	383
13. Nonlinear Iterations & Preconditioned Newton Flow	388
14. Summary & Proverbs	392
Table 12-1. Stationary One-Step Iterative Methods	394
Table 12-2. Extreme Eigenvalues for the Chebyshev Discretization of the 2D Poisson equation	395
Table 12-3. Condition Number \bar{n} for Preconditioned Chebyshev Operator in Two Dimensions	396
Table 12-4. The Upper 8 x 8 Block of a Fourier-Galerkin Matrix .	397
Table 12-5. Rescaled Upper Left 12 x 12 Block of an "Asymptotically Diagonal" Galerkin Matrix	397
Chapter 13. The Many Uses of Coordinate Transformation	
1. Introduction	404
2. Programming Chebyshev Methods	404
3. The General Theory of Coordinate Transformations	407
4. Mapping and Infinite and Semi-Infinite Intervals	408
5. Using Mapping to Resolve Endpoint & Coordinate Singularities	410
6. Eigenvalue Problems with Interior Singularities: Detours in the Complex Plane	413
7. Periodic Problems with Concentrated Amplitude & the Arctan/Tan Transformation	415
8. Two-Dimensional Maps & Singularity-Subtraction for Corner Branch Points	417

9. Adaptive Methods	420
Table 13-1. A FORTRAN Subroutine for Computing $T_n(x)$ and Its First Four Derivatives	423
Table 13-2. The First Ten Eigenvalues of a Sturm-Liouville Problem with an Interior Pole for Different N	424
Chapter 14. Methods for Unbounded Intervals	
1. Introduction	428
2. Whittaker Cardinal or "Sinc" Expansions	428
3. Hermite functions	435
4. Algebraically Mapped Chebyshev Polynomials: $TB_n(y)$	441
5. Behavioral versus Numerical Boundary Conditions	443
6. Expansions for Functions Which Decay Algebraically With y or Asymptote to a Constant	448
7. Numerical Examples for Rational Chebyshev Functions: $TB_n(y)$	451
8. Rational Chebyshev Functions on $y \in [0, \infty]$: $TL_n(y)$	453
9. Numerical Examples: Chebyshev Methods on a Semi-Infinite Interval	454
10. Methods for $f(y)$ Which Oscillate Without Exponential Decay at Infinity	457
11. Summary	460
Table 14-1. The Rational Chebyshev Function: $TB_n(y)$	461
Table 14-2. Examples of Functions Which Asymptote to a Constant or Decay Algebraically with the Corresponding Rational Basis Functions	462
Table 14-3. The Spectral Coefficients for the Rational Series for the Yoshida Ocean Jet for Various N	463
Chapter 15. Spherical Coordinates	
1. Introduction	475
2. Icosahedral Grids and the Radiolaria	475
3. The Parity Factor: Sphere versus Torus	476
4. The Pole Problem	480
5. Spherical Harmonics: An Overview	482
6. The Spherical Harmonics Addition Theorem & Equiareal Resolution	486
7. Spherical Harmonics and Physics	487
8. Asymptotic Approximations I: Polar-Cap & Bessel Functions	489
9. Asymptotic Approximations II: High Zonal Wavenumber & Hermite Functions	491
10. Alternatives to Spherical Harmonics: Parity-Modified Fourier Series & Robert Functions	493
11. Transformation of the Horizontal Velocities	496
12. Semi-Implicit Spherical Harmonic Methods for the Shallow Water Wave Equations	499
13. Vector Basis Functions: Vector Spherical Harmonics & Hough Functions	505
14. Cylindrical, Toroidal and Polar Coordinates	508
15. Elliptic & Elliptic Cylinder Coordinates	509
Table 15-1. An Illustration of Triangular Truncation	512
Chapter 16. Special Tricks	
1. Introduction	524
2. Sideband Truncation	526

3. Shock-Capturing & Shock-Fitting	530
4. Sum-Acceleration Methods	534
5. Special Basis Functions, I: Corner Singularities	536
6. Special Basis Functions, II: Wave Scattering	539
7. Special Basis Functions, III: Polynomial-Plus-Fourier Series for Non-Periodic Functions	544
Table 16-1. The Exact & Numerical Reflection Coefficients for Quantum Scattering of a Plane Wave	547
 Chapter 17. Analytical Applications and Symbolic Manipulation	
1. Introduction	551
2. Strategy: Interpolating versus Non-Interpolating Methods & the Choice of Basis Functions	553
3. Strategy, II: "Polynomialization" & "Rationalization" .	555
4. Implementing Spectral Methods in an Algebraic Manipulation Language	558
5. Examples	563
6. Open Problems	581
Table 17-1. Listing of REDUCE ODE-BVP Legendre-Galerkin Code ...	582
Table 17-2. The Maximum Pointwise Errors in the 4-Term Legendre Approximation	585
Table 17-3. A Comparison of Legendre-Based Rational Approximation with the Power Series for the Airy Function	586
Table 17-4. A REDUCE program to Derive the Two Equations in Two Unknowns for the Finlayson Nonlinear Diffusion Equ.	587
Table 17-5. Maximum Pointwise Errors for One and Two Point Collocation Solutions to Nonlinear Diffusion Equ....	588
 Chapter 18. The Tau-Method	
1. Introduction	590
2. Tau-Approximation for a Rational Function	592
3. Tau-Method for Differential Equations	595
4. Canonical Polynomials	596
5. Nomenclature Revisited	598
 Chapter 19. Domain Decomposition Methods	
1. Introduction	599
2. Notation	600
3. Connecting the Subdomains: Patching	600
4. The Weak Coupling of Elemental Solutions: the Key to Efficiency	603
5. Variational Principles	606
6. Choice of Basis & Grid: Cardinal versus Orthogonal Polynomial, Chebyshev versus Legendre, Interior versus Extrema-and-Endpoints Grid	609
7. Patching versus Variational Formalism	611
8. Matrix Inversion	612
9. The Influence Matrix Method	614
10. Two-Dimensional Mappings & Sectorial Elements	617
11. Prospectus	620
 Appendix A. A Bestiary of Basis Functions	
0. Trigonometric Basis Functions: Fourier Series	624
1. Chebyshev Polynomials $T_n(x)$	626
2. Chebyshev of the 2d Kind: $U_n(x)$	628
3. Legendre Polynomials: $P_n(x)$	629

4. Gegenbauer Polynomials	630
5. Laguerre Functions	631
6. Hermite Functions	632
7. Rational Chebyshev on $[-\infty, \infty]$, $TB_n(x)$	633
8. Rational Chebyshev on $[0, \infty]$, $TL_n(x)$	634
Table A-1. Flow Chart on Choice of Basis Functions	635
Fig. A-1. Regions of Convergence of Basis Sets in the Complex Plane	636

Appendix B. Matrix Methods

1. Gaussian Elimination & LU Decomposition	642
2. Block-Banded Elimination: the "Lindzen-Kuo" Algorithm .	646
3. Block and "Bordered" Matrices: the Fadeev-Fadeeva Factorization	650
4. Global Methods for Linear Eigenvalue Problems: The QR algorithm & the Pseudospectral Method	654
Table B-1. Operation Counts for Banded Matrices	656

Appendix C. The Newton-Kantorovich Method for Nonlinear Boundary and Eigenvalue Problems

1. Introduction	658
2. Examples	664
3. Eigenvalue Problems	666
4. Summary	673

Appendix D. The Continuation Method

1. Introduction	675
2. Examples	678
3. Initialization Strategies	679
4. Limit Points	684
5. Bifurcation Points	685
6. Pseudoarclength Continuation	688

Appendix E. Mapping Transformations

Introduction	699
Table E-1 [General Mapping]	701
Table E-2 [$y = \cos(x)$]	703
Table E-3 [$y = \arccos(x)$]	705
Table E-4 [$y = L \cot(x)$]	706
Table E-5 [$y = L x / (1 - x^2)^{1/2}$]	708
Table E-6. [$y = L \cot^2(x/2)$]	710
Table E-7. [$y = L (1+x) / (1-x) + r_0$]	712
Table E-8. [$y = L \operatorname{arctanh}(x)$]	713
2. Derivative Boundary Conditions	714

Appendix F. Cardinal Functions

1. Introduction	716
2. General Fourier Series: Endpoint Grid	717
3. Fourier Cosine Series: Endpoint Grid	718
4. Fourier Sine Series: Endpoint Grid	720
5. Sinc(x): Whittaker Cardinal Functions	722
6. Chebyshev Polynomials: Extrema & Endpoints Grid	724
7. Chebyshev Polynomials: Interior Grid	726

8. Legendre Polynomials: Extrema & Endpoints Grid	727
9. Cosine Cardinal Functions on the Interior [Rectangle Rule or Roots] Grid	728
10. Sine Cardinal Functions on the Interior [Rectangle Rule or Roots] Grid	729

Appendix G. Minimization of the Square of the Residual (Least Squares)
for Solving Differential Equations via Nonlinear Degrees of
Freedom

1. Introduction	730
2. Newton's Method	731
3. Linear Least-Squares Fitting and the Neglect of the Second Derivative	733
4. Evaluating the Second Derivatives for the Hessian Matrix	735
5. Steepest Descent	738
6. Convexity, Positive Definiteness, and Conditions for a Minimum	741
7. Approximations that Depend Nonlinearly on the Free Parameters	744
8. Nonlinear Approximation to the KdV Soliton: A Worked Example	746
Glossary	753
Bibliography	761
Errata	798
