

Contents

Preface	v
Notation	xiii
Chapter I · Box splines defined	
The analytic definition	1
A geometric description	2
The inductive definition	4
A univariate example	4
A bivariate example	5
Conventions	7
Basic properties	9
Fourier transform	9
Symmetries	10
Local structure and truncated power	11
Differentiation	13
Proof of basic properties	15
Recurrence relations	17
Example: four ways to construct a box spline	18
The support of the box spline	23
Zonotopes	27
Notes	30

Chapter II · The linear algebra of box spline spaces

Convolutions	34
Partition of unity	35
The box spline shifts which do not vanish at a given point	37
Differentiation	38
Linear independence	38
Example: the three-direction mesh	41
Example: the ZP element	41
The dimension of $D(\Xi)$	42
Tensor products	46
Three-direction mesh	46
The structure of $\Delta(\Xi)$	48
Example: four-direction mesh with multiplicities	52
The polynomials contained in S	52
A basis for $D(\Xi)$	53
Examples	55
D - and σ -invariance	57
Notes	58

Chapter III · Quasi-interpolants & approximation power

An upper bound	62
Quasi-interpolants	63
Convolutions on polynomial spaces	65
The semi-discrete convolution is a convolution on its range	66
Marsden identity	67
Quasi-interpolant summary	68
Appell sequence	68
Example: the ZP element	69
Choice of the quasi-interpolant functional	72
Minimality	73
Quasi-interpolants via Neumann series	74
Quasi-interpolants via Fourier transform	76
Example: the ZP element	77
Notes	78

Chapter IV · Cardinal interpolation & difference equations

Correct and singular cardinal interpolation	79
Example: univariate and bivariate quadratic box splines	80
Symbol and fundamental solution	81
Example: three-direction mesh	84
Correctness and linear independence	87
Example: centered hat function	88
Singular cardinal interpolation	92
Example: the centered ZP element	95
Bivariate four-direction box splines with even multiplicities	95
The approximation order of cardinal interpolation	99
Notes	101

Chapter V · Approximation by cardinal splines & wavelets

Fundamental domains	105
Properties of Ω_{Ξ}	108
Example: two-direction mesh	111
Example: three-direction mesh	114
Convergence of cardinal splines	117
Relation to cardinal series	120
Example: three-direction mesh	122
Wavelet decompositions	124
Wavelets in dimensions ≤ 3	132
Notes	135

Chapter VI · Discrete box splines & linear diophantine equations

Definition	137
Geometric description	138
Support	138
Convolution	139
Construction	139
Fourier transform	140
Differentiation	141
Annihilation	142
Linear independence	142
Linear diophantine equations	144
Linear independence (continued)	148
On extending to an element of $\Delta(\Xi)$	151

Discrete truncated power	154
The local structure of the discrete box spline	155
Local linear independence	156
Notes	157

Chapter VII · Subdivision algorithms

Masks	160
Geometric derivation of the refinement equation	161
Factorization of the mask	162
Example: two-direction mesh	164
Subdivision as discrete smoothing	164
Linear convergence of subdivision	165
Example: linear convergence is best possible	168
Quadratic convergence of subdivision	169
Example: the ZP element	172
Notes	173
