Editor's Foreword	v
Preface	vii
1. Introduction and Theory	
1.1 Introduction	1
1.2 General procedures and discretization by finite elements	6
1.3 The basic aims and scope of the book	8
1.4 The use of parabolic isoparametric elements	11
1.5 The finite element displacement method	12
1.6 Finite element program structure	19
1.7 Variable nomenclature	23
1.8 Program description scheme	24
References	24
2. Assembly of Elements and Solution of Stiffness Equations	
2.1 Introduction	25
2.2 Element assembly for a one-dimensional axial load member	25
2.3 Element assembly for a two-dimensional isoparametric element	28
2.4 Element assembly as a FORTRAN operation—subroutine ASSEMB	30
2.5 The solution of equations	33
2.6 Symmetric matrices and banded matrices	44
3. Input and Output	
3.1 Introduction	48
3.2 Input data	48
3.3 Control data	49
3.4 Geometric data	54
3.5 Boundary conditions	56
3.6 Material properties	58

3.7	Subroutine INPUT	59
3.8	Generation of coordinate values for midside nodes	63
3.9	Subroutine NODEXY	63
3.10	Subroutine GAUSSQ	64
3.11	Presentation of output	65
3.12	Automatic data preparation and output plotting	66
	References	67
4.	Isoparametric Beam Element	
4.1	Introduction	69
4.2	Element definition	71
4.3	Jacobian matrix	73
4.4	Strain definition	73
4.5	Stress-strain relationships	74
4.6	Stiffness matrix evaluation	74
4.7	Consistent nodal forces	75
4.8	Element stress resultants	75
4.9	Numerical integration	76
4.10	Subroutines	78
5.	Element Characteristics for Plane Stress/Strain	
5.1	Introduction and basic theory	96
5.2	Shape functions	98
5.3	Subroutine SFR2	101
5.4	Jacobian matrix and the Cartesian shape function derivatives	103
5.5	Subroutine JACOB2	104
5.6	Strain matrix— B matrix	107
5.7	Subroutine BMATPS	108
5.8	The matrix of elastic constants— D matrix	109
5.9	Subroutine MODPS	110
5.10	Stress matrix S	111
5.11	Subroutine DBE	112
5.12	The element stiffness matrix	112
5.13	Subroutine STIFPS	113
5.14	Calculation of element stresses	117
5.15	Subroutine STREPS	119
	References	122
6.	Element Characteristics for Plate Bending Applications	
6.1	Introduction and basic theory	124
6.2	Shape functions and their Cartesian derivatives	128
6.3	Strain matrix— B matrix	130

6.4	Subroutine BMATPB	130
6.5	The matrix of elastic rigidities D	132
6.6	Subroutine MODPB	132
6.7	Stress matrix— DB	133
6.8	The element stiffness matrix	134
6.9	Subroutine STIFPB	134
6.10	Calculation of element stress resultants	138
6.11	Subroutine STREPB	138
	References	140
7.	Equivalent Nodal Representation of Loads	
7.1	Introduction	143
7.2	Gravity loading for plane stress/strain situations	146
7.3	Normal and tangential loads/unit length applied to element edges for plane stress/strain situations	150
7.4	Thermal loading of solids under plane stress or plane strain conditions	157
7.5	Nodal point loads and assembly of loading subroutine	162
7.6	Loading data for plate bending situations	165
	References	169
8.	The Equation Solution Subroutine	
8.1	Introduction	171
8.2	General description of the frontal technique	171
8.3	The “Pre-front” section of the solution routine	172
8.4	Formulation of the destination, active variables and eliminated variables arrays	173
8.5	The actual assembly and elimination process	178
8.6	The backsubstitution phase	186
8.7	Equation re-solution facility	189
8.8	Discussion of the frontal technique.	189
8.9	The frontal solution subroutine	190
8.10	Summary	206
	References	206
9.	Data Checking and Error Diagnostics	
9.1	Introduction	208
9.2	Error diagnostic subroutine, CHECK1	208
9.3	Data echo subroutine, ECHO	211
9.4	Error diagnostic subroutine, CHECK2	212
9.5	List of error diagnostics	218
9.6	Illustrative examples	219
	References	226

10. Program Construction and Numerical Examples

10.1	Introduction	227
10.2	Common block organisation	227
10.3	The assembled programs	229
10.4	Numerical examples	234
	References	266

11. Discussion and Further Developments

11.1	Introduction	267
11.2	Element stiffness formulation	268
11.3	Multiple loading cases	269
11.4	Substructuring	269
11.5	Temporary storage of the reduced equations.	270
11.6	Variable number of degrees of freedom per node	271
11.7	Multiple elements	271
11.8	Equation re-resolution facility	272
11.9	Non-symmetric matrices	272
11.10	Inclined boundary axes	274
11.11	Sectorial symmetry	276
11.12	Stress analysis of three-dimensional solids and axisymmetric problems	276
11.13	The need for dynamic dimensions and associated diagnostics	277
11.14	External attached stiffnesses	278
11.15	Stress evaluation—smoothing techniques	278
11.16	Program structure	281
11.17	Further application of the programs	281
	References	282

Appendix I. Instructions for Preparing Input Data

A.1	Beam program, BEAM	285
A.2	The plane stress/strain program, PLANE	287
A.3	The plate bending program, PLATE	291

Appendix II. Dictionary of Variable Names 295

Index	303
