

# Contents

<b>Preface</b>	<b>ix</b>
<b>Introduction</b>	<b>xi</b>
The scope of computational physics	xi
Accuracy of computational methods	xiv
<b>1 Linear fitting and interpolation using transformation and least squares methods</b>	<b>1</b>
1.1 Interpolation by transformation	1
1.2 Polynomial interpolation	2
1.3 The cubic spline	6
1.4 Parametrisation of a function using Fourier coefficients	9
1.5 Least squares fitting	11
Exercises	17
References	17
<b>2 Applications of least squares fitting</b>	<b>18</b>
2.1 Introduction	18
2.2 Non-linear least squares fitting	19
Project 2A: Spin–lattice relaxation	21
Exercise	24
Project 2B: Superposition model of crystal fields acting on paramagnetic ions	24
Exercises	28
Project 2C: The ionic model of crystal polarisability	29
Exercises	32
Project 2D: Liquid-drop model of nuclei	32
Notes and comments	33
References	34
Appendix 2A: Interpretation of crystal-field parameters in the rare-earth-substituted garnets	37
Appendix 2B: Electronic polarisabilities of ions in alkali halide crystals	48
<b>3 The finite difference method</b>	<b>51</b>
3.1 Introduction	51
3.2 Finite difference method and partial differential equations	52

3.3	Solution of finite difference equations	56
3.4	An example	60
3.5	Successive over-relaxation	62
	Project 3A: Design of a proportional counter	64
*3.6	Direct methods for Poisson's equation	66
3.7	Initial value problems	69
	Exercises	71
	References	73
<b>4</b>	<b>The matrix eigenvalue problem and its application to molecular orbital theory</b>	<b>74</b>
4.1	Introduction	74
4.2	The direct method of finding all eigenvalues	74
4.3	The power method of finding a few eigenvectors and eigenvalues	77
4.4	Diagonalisation procedures	79
4.5	Molecular orbital theory	80
	Exercise	81
4.6	Planar molecules: Hückel theory	82
	Exercise	84
4.7	Molecular orbital theory for diatomic molecules	85
	Project 4A: LiH—A simple self-consistent field project	85
	References	89
	Appendix 4A: Self-consistent-field calculation on lithium hydride for undergraduates	91
<b>5</b>	<b>Energy levels as eigenvalues</b>	<b>94</b>
5.1	Introduction	94
5.2	Fitting parameters to eigenvalues	94
	Exercise	97
5.3	The crystal-field parametrisation	98
	Exercise	100
	Project 5A: Fitting crystal-field parameters to energy levels	100
5.4	Molecular vibrations	105
	Project 5B: Force constant model of the vibrational modes of CH <sub>3</sub> Cl(methyl chloride) and CH <sub>4</sub> (methane)	108
	References	112
<b>6</b>	<b>The finite element method</b>	<b>113</b>
6.1	Introduction	113
6.2	The method	115
6.3	An example	120
	Project 6A: Energy levels for a molecular potential	121

*6.4 Refinements to the method	124
*6.5 Basis in a variational principle	128
Exercises	131
References	132
<b>7 Monte Carlo methods</b>	<b>133</b>
7.1 Introduction	133
7.2 A random walk	135
7.3 Uniform random numbers	138
7.4 Random variates from an arbitrary distribution	141
7.5 Particle transport	150
*7.6 Variance reduction techniques	154
Exercises	159
References	163
<b>8 Applications of the Monte Carlo method</b>	<b>165</b>
8.1 Introduction	165
8.2 The reactor criticality problem	165
Project 8A: Enrichment of natural uranium	168
8.3 Thermal systems in general	170
Project 8B: An ideal gas	171
8.4 Interacting thermal systems	172
Project 8C: A magnetic dipole system—the Ising model	174
8.5 Random walks and macromolecular chains	178
Project 8D: Coefficient of thermal expansion of an idealised polymer	179
*8.6 Polymer chains with interactions	181
*Project 8E: The Flory ( $\Theta$ ) temperature for a polymer	183
8.7 The Monte Carlo method in quantum mechanics	186
*Project 8F: The ground state wavefunction for a simple harmonic oscillator	192
Exercises	195
References	196
<b>Appendix: Mathematical background</b>	<b>198</b>
A.1 Statistical concepts	198
A.2 Useful distributions	199
A.3 The chi-squared test	203
A.4 Real matrices	206
References	209
