PROLOGUE	xv
1. AN OVERVIEW OF NUMERICAL SIMULATION	1
1–1. Some Comments on Terminology	1
1–2. Three Types of Physical Models	2
1–3. Levels of Simulation	4
1–4. A Bridge between Theory and Experiment	5
1–5. The Tyranny of Numbers	8
1–6. Themes of This Book	9
References	10
2. THE REACTIVE FLOW MODELING PROBLEM	11
2–1. Reactive Flow Conservation Equations	11
1.1 Time-Dependent Conservation Equations	11
1.2 The Continuum Representation	15
1.3 Physical Phenomena Represented in the Equations	17
1.4 Boundary and Initial Conditions	18
2–2. Discussion of the Conservation Equations	19
2.1 Equations of Fluid Dynamics	19
2.2 Equations of State	22
2.3 Equations of Chemical Reaction Kinetics	23
2.4 Equations of Diffusive Transport	24
2.5 Equations of Radiation Transport	25
2.6 Characteristic Trajectories	26
2.7 Classification of Partial Differential Equations	27
2.8 Dimensionless Numbers	28
2.9 Finding Input Data	32
2–3. Fluid Dynamics with Chemical Reactions	33
3.1 Feedback and Interaction Mechanisms	33
3.2 Three Reactive Flow Problems	36
References	40
3. MODELS AND SIMULATION	42
3–1. Developing a Numerical Simulation Model	43
1.1 Posing Scientific Problems for Modeling	43
1.2 Choosing the Computational Representation	45

3–2. Limiting Factors and Constraints	47
2.1 Limitations in Accuracy	48
2.2 The Costs of Complexity	51
2.3 Using Phenomenological Models	54
3–3. Constructing and Testing the Model	57
3.1 Trade-Offs in Selecting and Optimizing Models	58
3.2 Steps in Constructing a Simulation Model	59
3.3 An Example: Simulating a Propagating Laminar Flame	61
3.4 Testing Programs and Models	66
3–4. Using Time Efficiently	69
4.1 Partitioning Time among Tasks	69
4.2 Documenting and Retrieving Results of Simulations	70
4.3 Working with Others	71
4.4 Some General Programming Guidelines	73
4.5 Starting Over	76
References	76
4. SOME GENERAL NUMERICAL CONSIDERATIONS	78
4–1. Introduction to Finite Differences	78
1.1 Discretizing Time and Space	78
1.2 Advancing Equations in Time and Space	81
1.3 Qualitative Properties of Numerical Algorithms	83
1.4 Approaches to Analyzing Accuracy	86
1.5 Types of Finite-Difference Errors	88
4–2. Local Processes and Chemical Kinetics	91
2.1 Explicit and Implicit Solutions	91
2.2 Asymptotic Solutions	96
4–3. Diffusive Transport	99
3.1 The Diffusion Equation	99
3.2 An Analytic Solution: Decay of a Periodic Function	100
3.3 Explicit and Implicit Solutions	101
3.4 The Cost of Implicit Methods	105
3.5 Physical Diffusion and Numerical Diffusion	105
4–4. Convective Transport	106
4.1 Fluid Dynamic Flows: Advection and Compression	106
4.2 The Square-Wave Test Problem	108
4.3 Explicit and Implicit Solutions	110
4.4 Phase and Amplitude Errors for Common Algorithms	115

4–5. Waves and Oscillations	118
5.1 Waves from Coupling Continuity Equations	118
5.2 An Explicit Staggered Leapfrog Algorithm	120
5.3 A Reversible Implicit Algorithm	123
5.4 Reversibility, Stability, and Accuracy	125
4–6. Coupling	126
6.1 Problems in Coupling the Terms	126
6.2 Global-Implicit Coupling	128
6.3 Timestep Splitting or Fractional-Step Coupling	130
6.4 Trade-offs in the Choice of a Coupling Method	131
References	133
5. ORDINARY DIFFERENTIAL EQUATIONS: CHEMICAL KINETICS AND OTHER LOCAL PHENOMENA	134
5–1. Definitions and Properties	136
1.1 The Initial Value Problem	136
1.2 Accuracy, Convergence, and Stability	137
1.3 Implicit and Explicit Solutions	142
1.4 Stiff Ordinary Differential Equations	142
5–2. Overview of Classical Methods of Solution	144
2.1 One-Step Methods	144
2.2 Linear Multistep Methods	147
2.3 Extrapolation Methods	149
2.4 Leapfrog Integration Methods	151
5–3. Some Approaches to Solving Stiff Equations	153
3.1 Stability and Stiff ODEs	154
3.2 Implicit Methods for Stiff ODEs	157
3.3 Methods for Solving Stiff Equations	158
3.4 Summary: Some Important Issues	163
5–4. Integration Packages	164
4.1 Programs Based on the GEAR Method	165
4.2 An Asymptotic Integration Method	166
4.3 An Exponentially Fitted Method	168
4.4 Semi-Implicit Extrapolation Methods	168
4.5 The Kregel Method	169
5–5. Sensitivity Analysis	170
5.1 Local Sensitivity Methods	170
5.2 Global Sensitivity Methods	173

5.3 General Thoughts on Sensitivity Analysis	176
5–6. Chemical Kinetics Calculations	177
6.1 Chemical Kinetics in Reactive Flows	177
6.2 Solving the Temperature Equation	178
6.3 Applications to Chemical Kinetics	179
References	180
6. REPRESENTATIONS, RESOLUTION, AND GRIDS	186
6–1. Representations of Convective Flows	186
1.1 Why Convection is Difficult to Simulate	186
1.2 The Continuity Equation	188
1.3 Lagrangian vs Eulerian Representations	189
6–2. Representing a Continuous Variable	190
2.1 Eulerian, Grid-Based Representations	190
2.2 Expansion and Spectral Representations	195
2.3 Lagrangian Representations	197
2.4 The Method of Lines	198
6–3. Resolution and Accuracy on a Grid	200
3.1 Errors Introduced by Grid Representations	200
3.2 Resolution and Accuracy	203
3.3 Introduction to Multidimensional Grids	203
6–4. Techniques for Adaptive Gridding	208
4.1 Rezoning to Improve Resolution	208
4.2 Eulerian Adaptive Gridding	210
4.3 Lagrangian Adaptive Gridding	217
4.4 Embedded Grid and Multigrid Techniques	220
References	222
7. DIFFUSIVE TRANSPORT PROCESSES	226
7–1. The Diffusion Equation	227
1.1 The Physical Origin of Diffusive Effects	227
1.2 The δ -Function Test Problem	229
1.3 Short- and Long-Wavelength Breakdowns	233
1.4 Numerical Diffusion and Instability	234
7–2. Integration of the Diffusion Equation	235
2.1 A Finite-Difference Formula in One Dimension	235
2.2 Implicit Solutions using Tridiagonal Matrix Inversions	236
2.3 Large Variations in Δx and D	237

7–3. Nonlinear Effects and Strong Diffusion	240
3.1 Nonlinear Diffusion Effects	240
3.2 Numerical Techniques for Nonlinear Diffusion	244
3.3 Asymptotic Methods for Fast Diffusion	246
3.4 Flux-Limiters	247
7–4. Multidimensional Algorithms	248
4.1 Implicit, Explicit, and Centered Algorithms	248
4.2 ADI and Split-Direction Methods	251
7–5. Solving for Species Diffusion Velocities	251
5.1 The Fickian Diffusion Approximation	252
5.2 An Efficient Iterative Algorithm	253
7–6. Evaluating Diffusive Transport Coefficients	256
6.1 Thermal Conductivity	256
6.2 Ordinary (or Molecular or Binary) Diffusion	257
6.3 Thermal Diffusion	258
6.4 Viscosity	259
6.5 Diffusive Transport for Hydrogen Combustion	260
References	263
8. THE CONTINUITY EQUATION: EULERIAN METHODS	264
8–1. Lax-Wendroff Methods	265
1.1 The Basic One-Step Method	265
1.2 Two-Step Richtmyer Methods	267
1.3 MacCormack Method	269
1.4 Artificial Diffusion	269
8–2. Positivity and Accuracy	270
8–3. Flux-Corrected Transport	275
3.1 The Basic Idea of Flux-Corrected Transport	276
3.2 The Subroutine LCPFCT	279
8–4. Zalesak’s Generalization	285
8–5. Resolution and Reynolds Number Limitations	289
8–6. Approaches to Monotonicity	292
6.1 A Classification of Monotone Methods	292
6.2 Tests of Monotone Methods	294
6.3 Comments on Monotone Methods	298
8–7. Spectral and Finite-Element Methods	298
7.1 Continuous Representations	299

7.2 Spectral Methods	301
7.3 Finite-Element Methods	304
References	309
9. COUPLED CONTINUITY EQUATIONS FOR FAST AND SLOW FLOWS	314
9–1. Coupled Continuity Equations	314
1.1 Equations of Incompressible and Compressible Flow	314
1.2 Time Integration	317
1.3 Calculating Fast and Slow Flows	318
9–2. Methods for Fast Flows	319
2.1 Lax-Wendroff Methods	320
2.2 FCT for Coupled Continuity Equations	323
2.3 Multidimensions through Timestep Splitting	325
2.4 The Riemann Problem and Riemann Methods	328
2.5 Comparison of Several Methods	331
2.6 Several Other Methods	337
9–3. Methods for Slow Flows	339
3.1 Slow-Flow Methods	340
3.2 An Implicit Flux-Corrected Transport Algorithm	343
3.3 Several Implicit Algorithms	348
3.4 Lagrangian Algorithms	352
References	353
10. LAGRANGIAN METHODS	358
10–1. A One-Dimensional Lagrangian Method	359
1.1 The Basic Equations	360
1.2 The Numerical Algorithm	362
1.3 Some General Comments	367
10–2. General Connectivity Triangular Grids	368
2.1 The Triangular Grid	368
2.2 Finite Differences on a Triangular Grid	370
2.3 Equations for Incompressible, Inviscid Flow	371
2.4 Conservation of Circulation	373
2.5 Viscous Flows	374
2.6 Conservation of Vertex-Cell Areas	375
2.7 Grid Restructuring	377
2.8 Some General Comments	379

10-3. Quasiparticle Methods	379
10-4. Vortex Dynamics Methods	382
4.1 Point Vortex Methods	383
4.2 Distributed-Core Vortex and Filament Methods	384
4.3 Contour Dynamics	387
4.4 Vortex-in-Cell Methods	387
4.5 Some Comments on Vortex Methods	388
10-5. The Monotonic Lagrangian Grid	388
References	392
11. BOUNDARIES, INTERFACES, AND MATRIX ALGORITHMS	395
11-1. Boundary Conditions	396
1.1 Boundary Conditions for Confined Domains	398
1.2 Boundary Conditions for Unconfined Domains	406
11-2. Interfaces and Discontinuities	416
2.1 Resolving Active Interfaces	416
2.2 Moving-Grid Methods	419
2.3 Surface-Tracking Methods	423
2.4 Volume-Tracking Methods	425
2.5 The Gradient Method	429
11-3. Matrix Algebra for Finite Differences	432
3.1 Statement of the Problem	432
3.2 Exact Solution of the Matrix Equation	435
3.3 Tridiagonal Matrices	436
3.4 Direct Solutions of the Poisson Equation	438
3.5 Iterative Solutions of Elliptic Equations	441
3.6 Summary	448
References	449
12. DIFFICULT TOPICS	455
12-1. Turbulence	455
1.1 Detailed Simulations of Turbulence	456
1.2 The Ideal Turbulence Model	462
1.3 Turbulence-Averaged Navier-Stokes Equations	464
1.4 Subgrid Turbulence Models	469
1.5 Problems in Modeling Reactive Flow Turbulence	471
1.6 Concluding Remarks	476
12-2. Radiation Transport	477
2.1 The Physical Basis of Radiation Transport	478

2.2 The Equation of Radiative Transfer	480
2.3 The Radiant Energy Flux	484
2.4 Some Important Limiting Cases	485
2.5 More General Approaches	486
2.6 The Radiation Diffusion Approximation	488
2.7 The Variable Eddington Approximation	489
12–3. Multiphase Flows	492
3.1 Interactions among Phases	493
3.2 Equations for Multiphase Flows	497
3.3 Spray and Droplet Models	501
3.4 A Model of Deflagration-to-Detonation Transition	505
3.5 Even More Basic Models	510
3.6 Modeling Multiphase Flows	510
References	512
13. MODELS FOR SHOCKS, FLAMES, AND DETONATIONS	518
13–1. One-Dimensional Supersonic Reactive Flows	518
1.1 The Structure of RSHOCK Models	519
1.2 Timestep Splitting	521
1.3 Calculations with Reactions and Shocks	525
13–2. Multidimensional Compressible Reactive Flows	532
2.1 Structure and Coupling in FAST2D	533
2.2 Some Examples	539
13–3. One-Dimensional Subsonic Reactive Flows	549
3.1 Structure of FLAME1D Models	549
3.2 Timestep Splitting	552
3.3 Several Examples	553
13–4. A Two-Dimensional Lagrangian Model	558
4.1 The Structure of SPLISH	559
4.2 Surface Tension	562
4.3 Flows in and around Droplets	563
13–5. Rules of Thumb	569
References	572
INDEX	579
