

Contents of Volume 2

Part III Statistical physics

Chapter 1 The basic concepts of the theory of probability

§ 1	Problems of statistical physics. Necessary results from classical and quantum mechanics	1
2	Basic ideas of the theory of probability	19
3	Mean values and fluctuations	25
4	Normal distribution and moments	31
5	The correlation function	35

Chapter 2 The kinetic theory of gases

6	The simplest statistical system — an ideal gas	39
7	The Maxwell distribution	43
8	Collisions of molecules with the wall of the container. Pressure. The connection of the parameter α with the absolute temperature	47
9	Properties of the Maxwell distribution	51
10	The calculation of characteristic quantities	55
11	Collisions of molecules with each other	59
12	The mean free path	62

Chapter 3 Statistical distribution

13	Quasi-independent systems	66
14	Statistical distribution	68
15	The probability of a state of a system	70
16	The Gibbs distribution	75
17	The statistical temperature	82
18	The properties of the Gibbs distribution and statistical equilibrium	84

§ 19	Transition to classical statistics	86
20	The monatomic gas as a whole	91

Chapter 4 Statistical and phenomenological thermodynamics

21	The internal energy of a macroscopic system. The first and second laws of thermodynamics	97
22	Work and pressure	101
23	The change in the energy of a system in the general case of a quasi-static process	103
24	Entropy and the basic thermodynamic equality	108
25	The law of increase of entropy	111
26	The basic thermodynamic inequality	116
27	The maximum work to be obtained from thermal processes. The impossibility of constructing a perpetual motion machine of the second kind. Phenomenological definition of the entropy	118
28	The maximum work in non-cyclic processes and the thermodynamic potentials	124
29	Properties of the thermodynamic potentials	127
30	Some thermodynamic relations	130
31	Methods for the transformation of thermodynamic quantities	132
32	The determination of thermodynamic quantities by the methods of statistical physics	137
33	The determination of thermodynamic quantities from experimental data	141
34	Throttling	144
35	The third law of thermodynamics	147
36	The statistical character of the second law of thermodynamics	153

Chapter 5 Ideal gases

37	The distribution function for ideal gases	164
38	The Maxwell–Boltzmann distribution and the Boltzmann distribution in a uniform field of force	174
39	The calculation of the heat capacity of diatomic molecules by means of classical statistics. The law of equipartition of energy over degrees of freedom	179

§40	The thermodynamic functions of a system which can be in two quantum states	190
41	Diatomic molecules	194
42	Thermodynamic functions of diatomic gases	200
43	The vibrational partition function and the contribution of vibrations to the energy and heat capacity	202
44	The rotational partition function and the contribution of rotation to thermodynamic functions	208
45	Polyatomic molecules	213

Chapter 6 Systems of interacting particles

46	Interaction between molecules in non-ideal gases	220
47	The correlation function method and its application to the theory of dense gases and liquids	230
48	Equations for correlation functions	232
49	The equation of state and the energy of a system of interacting particles	235

Chapter 7 Crystals

50	Crystal structure and thermal motion in the one-dimensional crystal model	242
51	Long waves in a three-dimensional crystal	256
52	The partition function of a crystal	260
53	The thermodynamic functions of a crystal	263
54	Comparison of theory with experiment	265

Chapter 8 The theory of fluctuations

55	Small fluctuations in macroscopic systems	270
56	Brownian motion	276
57	Fluctuations of thermodynamic quantities in a homogeneous system	284
58	Effect of fluctuations on the sensitivity of measuring devices	290

Chapter 9 Systems with a variable number of particles

59	The Gibbs grand canonical distribution	294
60	The basic thermodynamic equality and the calculation of chemical potentials	301
61	Conditions of phase equilibrium	305

§ 62	The equation of the phase equilibrium curve. Equilibrium between the vapour and the condensed phase	307
63	Theory of phase transitions	315
64	Phase equilibrium curves	320
65	Surface tension and surface pressure	325
66	Gas adsorption	331
67	Chemical equilibrium in the gas phase	334
68	The law of mass action	336
69	Thermal dissociation of atoms	340

Chapter 10 Statistical distributions in quantum statistics and some of their applications

70	The identity of elementary particles and the calculation of the partition function	343
71	A second method of deriving the statistical distribution	345
72	Quantum distributions for an ideal gas	348
73	Black-body radiation	356
74	The classical theory of black-body radiation	360
75	The Planck formula	362
76	The statistics of the photon gas	365
77	The properties of liquid helium II	371
78	Statistical theory of liquid helium II	375
79	The electron gas at absolute zero	381
80	The electron gas at low temperatures	385

Part IV Electromagnetic processes in matter

Chapter 1 Electromagnetic fields in matter

§ 1	The derivation of the basic field equations	397
2	The polarization of a medium in an electric field	400
3	The mean current density and mean charge density in a medium	403
4	The system of equations for the electromagnetic field in a medium	409
5	Boundary conditions	413

§ 6	The limits of applicability of the system of constitutive equations	416
7	The law of conservation of energy in a medium	419

Chapter 2 Electrostatics

8	The electrostatic field	422
9	The solution of electrostatic problems	427
10	The method of images and method of inversion	430
11	The energy of a system of conductors	435
12	Dielectrics and conductors in an external electrostatic field	437
13	The thermodynamic potentials of a dielectric and the dielectric susceptibility	441

Chapter 3 Direct electric current and the magnetic properties of matter

14	Ohm's law	452
15	A linear conductor carrying a constant current	455
16	Direct current in a conducting medium	457
17	The magnetic fields of direct currents. The Biot—Savart law	460
18	The magnetization of magnetic materials and the magnetic moment	464
19	Paramagnetic susceptibility	471
20	Ferromagnetism. Spontaneous magnetization and hysteresis	476
21	Superconductivity	485

Chapter 4 Quasistationary electromagnetic fields

22	Conditions of quasistationarity	493
23	The law of induction in moving conductors and media	496
24	Maxwell's equations for quasistationary fields in integral form and their integration for the case of linear conductors	499
25	The energy of the magnetic field of a system of quasistationary currents	505
26	Coefficients of self-inductance and mutual inductance for non-linear conductors	508
27	Lagrange's equations for a system of quasistationary currents	512
28	The generalized ponderomotive forces in a system with moving current loops	517

§29	Fluctuations in conductors and the Nyquist formula	523
30	Skin effect	528
 <i>Chapter 5 High-frequency fields</i>		
31	Electromagnetic waves in a homogeneous isotropic medium	533
32	Dispersion relations (the Kramers–Kronig formulae)	540
33	The electromagnetic field in a medium with spatial and time dispersion	544
34	The dispersion of light	549
35	Geometrical optics	555
36	Diffraction	560
37	The reflection and refraction of electromagnetic waves at the boundary between media	570
38	Wave-guides	577
39	The passage of fast particles through matter	585
 <i>Chapter 6 Matter in the plasma state</i>		
40	The general characteristics of plasma	595
41	Equilibrium plasma	597
42	Plasma in static electric and magnetic fields	605
43	Magnetic isolation and the pinch effect	610
44	The magnetic field in a moving plasma	613
45	Magnetohydrodynamic waves	617
46	Plasma in a high-frequency electric field	622
Appendix IV Important integrals. Stirling's formula		629
Subject index		633
