## Part V Quantum mechanics

### *Chapter 1 The basic concepts of quantum mechanics*

§ 1	The physical basis of quantum mechanics	3
2	The wave function	10
3	The principle of superposition. Expansion in plane waves	16
4	Uncertainty relations and the relationship between quantum mechanics and classical mechanics	19
5	The principle of causality in quantum mechanics	23

### *Chapter 2 The Schrödinger equation*

6	The Schrödinger wave equation	26
7	The probability current density	30
8	A particle in a one-dimensional rectangular potential well	32
9	A particle in a three-dimensional rectangular potential well	36
10	The quantum-mechanical oscillator	37
11	The three-dimensional oscillator	43
12	Reflection from and penetration through a potential barrier	44
13	One-dimensional motion	52
14	The Schrödinger equation for a system of particles	55

### *Chapter 3 The mathematical apparatus of quantum mechanics*

15	Linear operators	59
16	Eigenvalues and eigenfunctions of operators	63
17	Hermitian operators	65
18	The orthogonality and normalization of the eigenfunctions of Hermitian operators	67
19	Expansion in terms of eigenfunctions	69
20	Quantum-mechanical variables and operators	71

§21	The wave function and the probability of the results of measurements	73
22	Mean values	75
23	Commutation of operators	78
24	Heisenberg inequalities	82
25	Poisson brackets	84
26	Coordinate and momentum operators and eigenfunctions	86
27	The Hamiltonian operator	92
28	Stationary states	94
29	Integral form of the Schrödinger equation	96
30	The eigenvalues and eigenfunctions of the angular momentum operator and of the operator of the square of the angular momentum	101
31	Differentiation of operators with respect to time	108
32	Constants of the motion	111
33	Parity	114
34	The uncertainty relation for time and energy	117
 <i>Chapter 4 Motion in a centrally symmetric field</i>		
35	The Schrödinger equation	121
36	The free motion of a particle with given angular momentum	130
37	The spherical well	132
38	Motion in a Coulomb field	135
 <i>Chapter 5 The quasi-classical approximation</i>		
39	The limiting transition to classical mechanics	145
40	The solution of the Schrödinger equation near a turning point	150
41	Motion in a potential well in the quasi-classical approximation	155
42	Potential barrier penetration	158
43	Quasi-classical motion in a centrally symmetric field	162
 <i>Chapter 6 The matrix form of quantum mechanics</i>		
44	Operators and matrices	164
45	The fundamentals of matrix calculus	168
46	Geometric interpretation of the wave function. Canonical transformations	176

§47	The eigenfunctions and eigenvalues of an operator given in matrix form	180
48	Continuous matrices. The Dirac notation	183
49	The Schrödinger representation, the Heisenberg representation and the interaction representation	190
50	The linear harmonic oscillator	195
51	The matrix elements of the angular momentum operator	199
52	The addition of angular momenta	204
 <i>Chapter 7 Perturbation theory</i>		
53	The theory of time-independent perturbations	209
54	Perturbation theory in the presence of degeneracy	214
55	The theory of time-dependent perturbations	219
56	The transition of a system into new states under the action of perturbations	222
57	The adiabatic theory of perturbations	229
58	Perturbation theory in integral form	232
 <i>Chapter 8 Spin and identity of particles</i>		
59	The spin of elementary particles	234
60	Spin operators	236
61	The eigenfunctions of the operators of the components of the spin of a particle. The rotation matrix	240
62	The total angular momentum	248
63	The Pauli equation. The probability current density vector	250
64	The identity of particles. The principle of identity of particles. Symmetric and antisymmetric states	254
65	Wave functions for systems of fermions and bosons. The Pauli principle	257
66	The wave function of a system of two identical particles with spin $\frac{1}{2}$	261
67	Exchange interaction and the concept of the chemical and strong nuclear interactions	264
 <i>Chapter 9 Applications of quantum mechanics to atomic and nuclear systems</i>		
68	The helium atom	276

§ 69	The variational principle	280
70	The self-consistent field method (Hartree–Fock method)	282
71	The statistical model of the atom	285
72	The quantum numbers characterizing the states of electrons in atoms	293
73	The periodic system of the elements	299
74	The Zeeman effect	307
75	The Paschen–Back effect and the diamagnetism of atoms	312
76	Deuteron theory	314
77	Nuclear-shell theory	320
 <i>Chapter 10 The theory of diatomic molecules</i>		
78	The adiabatic approximation and the classification of electron terms	323
79	The hydrogen molecule. Ideas of the theory of chemical binding	326
80	The interaction of atoms at large distances	334
81	The comparison of molecular terms with atomic terms	337
82	Rotation and vibration of diatomic molecules	339
 <i>Chapter 11 Scattering theory</i>		
83	Scattering amplitude and cross section	345
84	The Born approximation	350
85	The scattering of fast charged particles by atoms	354
86	Partial wave scattering theory	357
87	Scattering by a spherical potential well (the concept of resonance scattering)	364
88	The elastic scattering of identical particles	368
89	The effect of polarization in scattering processes	371
90	The transition to the classical limit in the quantum scattering formulae	378
91	The general theory of inelastic scattering and the absorption of particles	385
92	The diffraction of fast neutrons by nuclei	391
93	The scattering of slow particles. The threshold approximation	394
94	The Breit–Wigner formula	396
95	The scattering matrix ( <i>S</i> -matrix)	401
96	<i>S</i> -matrix and perturbation theory	408

§ 97	Analytic properties of the $S$ -matrix	412
98	Time reversal and the principle of detailed balance	418
<i>Chapter 12 The method of second quantization and radiation theory</i>		
99	Second quantization for systems of bosons and fermions	423
100	The quantum mechanics of the photon	431
101	The quantization of the radiation field	436
102	The interaction of an electron with radiation	439
103	The absorption and emission of light	442
104	Dipole transitions in atomic systems	446
105	Quadrupole and magnetic dipole radiation	448
106	Selection rules	449
107	The photoelectric effect	452
108	The scattering of light by atoms	456
109	The theory of the natural linewidth	462
<i>Chapter 13 Relativistic quantum mechanics</i>		
110	The relativistic wave equation for a particle of zero spin	468
111	The charge density and probability current for particles of zero spin	470
112	The concept of the nuclear force field	473
113	The Dirac equation	476
114	The probability density and probability current in Dirac's theory	482
115	The solution of the Dirac equation for a free particle	483
116	The concept of the positron	487
117	The spin of particles described by the Dirac equation	492
118	The transition from the Dirac equation to the Pauli equation. The magnetic moment of a particle	494
119	The hydrogen atom in Dirac's theory	497
120	The invariance of the Dirac equation with respect to reflection, rotation and Lorentz transformation of coordinates	499
121	The laws of transformation of bilinear combinations made up of wave functions	502
122	The concept of weak interactions. Parity non-conservation	504
123	Two-component neutrino theory. The universal four-fermion interaction	509

*Chapter 14 Some problems of quantum electrodynamics*

§124	The Green's function of the Dirac equation	517
125	Green's function for a system of two particles	524
126	Feynman diagrams	527
127	The Compton effect	535
128	The shift of the terms of the hydrogen atom under the action of the vacuum field (the Lamb shift)	543

*Chapter 15 Fundamentals of the theory of elementary particles*

129	The classification and properties of elementary particles	549
130	The types of interactions of elementary particles	554
131	Symmetry groups in quantum mechanics	556
132	The isogroup SU(2) and its representations	562
133	Isomultiplets of elementary particles	567
134	The wave functions of a system of nucleons and $\pi$ -mesons	573
135	Isotopically invariant interaction	576
136	The scattering of nucleons and $\pi$ -mesons	580
137	The unitary group SU(3) and its representations	585
138	The eightfold way formalism and unitary multiplets	590
139	Some consequences of strict unitary symmetry	595
140	Some aspects of violated unitary symmetry	601
141	Composite models in the unitary symmetry scheme. Quarks	604
142	General appraisal of unitary symmetry	609
