

CONTENTS

<i>Preface</i>	vii
1. Experiments on Quantization	
1. Introduction	1
2. The Millikan Oil Drop Experiment	2
3. The Frank-Hertz Experiment	8
4. The Photoelectric Effect	18
2. Simple Quantum-Mechanical Systems	
1. Introduction	28
2. Experiment on the Hydrogen Spectrum	32
3. The Prism Spectrograph	37
4. The Sodium and Mercury Spectrum	43
5. Line Spectra of Nuclei	52
3. Quantum-Mechanical Systems with Large Numbers of Interacting Particles	
1. Introduction	57
2. Thermionic Emission of Electrons from Metals	65
3. Some Properties of Semiconductors	80

4.	Sketch of p - n Semiconductor Junction Theory	99
5.	Contact and Thermoelectric Effects at Junctions of Metals	103
4.	Useful Techniques	
1.	Introduction	107
2.	Transistor Switching Circuits	108
3.	Electronic Functional Assemblies	113
4.	Vacuum Techniques	126
5.	Radiation Safety and Handling of Radioactive Materials	137
5.	Radiation and Particle Detectors	
1.	General Considerations	150
2.	Interaction of Charged Particles and Photons with Matter	152
3.	Gaseous Ionization Instruments; the Geiger Counter	175
4.	The Scintillation Counter	194
5.	Solid-State Particle Detectors	208
6.	Some Other Detectors	218
6.	Scattering Experiments	
1.	Introduction	226
2.	Rutherford Scattering	231
3.	Compton Scattering	252
4.	Mössbauer Effect	265
7.	High-Resolution Spectroscopy	
1.	Introduction	280
2.	The Zeeman Effect	283
3.	Hyperfine Structure	294
4.	Line Width and Light Sources for High-Resolution Spectroscopy	306
5.	The Fabry-Perot Interferometer	309
6.	The Zeeman Effect of the $\lambda = 5461 \text{ \AA}$ Line of Hg^{198}	320
7.	The High-Resolution Grating; Observation of Hyperfine Structure and of the Zeeman Effect	328

8. Magnetic Resonance Experiments	
1. Introduction	340
2. Magnetic Dipole Transitions between the <i>m</i> -Sublevels of a Quantum-Mechanical System	344
3. Absorption of Energy by the Nuclear Moments	350
4. Experimental Observation of the Nuclear Magnetic Resonance of Protons	358
5. Electron Paramagnetic Resonance	374
6. The "Double Resonance" Experiment	390
9. Time Coincidence Techniques	
1. Introduction	395
2. Coincidence Circuits	397
3. Angular Correlation Measurements	412
4. Elementary Discussion of the γ - γ Angular Correlation in Nuclear Decay	424
5. Velocity Measurements and Particle Identification by Time of Flight	429
10. Elements from the Theory of Statistics	
1. Definitions	438
2. Frequency Functions of One Variable	445
3. Estimation of Parameters and Fitting of Data	458
4. Errors and Their Propagation	467
5. The Statistics of Nuclear Counting	479
Appendix	
I. Useful Constants and Relations	490
II. Dimensions and Units of Some Physical Quantities	494
III. Materials Used as Absorbers and Detectors	496
IV. Some Electronic Properties of Atoms	497
V. Table of Nuclear Species	500
VI. Masses and Mean Lives of Elementary Particles	548
VII. The Lorentz Transformation and Some Relativistic Kinematics Formulas	549
<i>Subject Index</i>	553
