

## CONTENTS

PREFACE	v
PART I: ALGEBRAIC AND TRANSCENDENTAL EQUATIONS	
1. Introduction to nonlinear algebraic equations	3
2. Methods for systems of algebraic equations	20
3. Functional equations, fixed points and the Newton-Kantorovich theory	32
4. Nonlinear eigenvalue problems	43
5. Solution of polynomial equations	56
6. Globally convergent methods for zeros and fixed points	69
PART II: INITIAL-VALUE PROBLEMS IN ORDINARY DIFFERENTIAL EQUATIONS	
7. Initial-value problems in ordinary differential equations	95
8. Stiff problems in differential equations: treatment of the algebraic equations	112
9. The theory of discretizations	121
PART III: BOUNDARY-VALUE PROBLEMS IN ORDINARY DIFFERENTIAL EQUATIONS	
10. Implicit methods for boundary-value problems	137
11. Shooting methods and parametrized problems	148
12. Applications of continuation techniques in ordinary differential equations	159
13. Stability	171
PART IV: PARTIAL DIFFERENTIAL EQUATIONS	
14. Variational principles for non-linear partial differential equations	187
15. Parabolic equations	195
PART V: INTEGRAL EQUATIONS	
16. Nonlinear Fredholm equations; discretization and stability	207
17. Bifurcation in Fredholm integral equations	220
18. Volterra integral equations	233

PART VI: APPROXIMATION

19.	Discrete rational approximation	249
20.	Exponential approximation using Prony's method	258
21.	Algorithms for nonlinear approximation	270
22.	Strong uniqueness in nonlinear approximation	287

PART VII: PROGRAMMING TECHNIQUES

23.	Techniques for large-scale problems	307
