

# Contents (Volume II)

CHAPTER VI	
Non-Jeans Instabilities of Gravitating Systems	1
§ 1. Beam Instability of a Gravitating Medium	2
1.1. Theorem of a Number of Instabilities of the Heterogeneous System with Homogeneous Flows	2
1.2. Expression for the Growth Rate of the Kinetic Beam Instability in the Case of a Beam of Small Density (for an Arbitrary Distribution Function)	5
1.3. Beam with a Step Function Distribution	7
1.4. Hydrodynamical Beam Instability. Excitation of the Rotational Branch	8
1.5. Stabilizing Effect of the Interaction of Gravitating Cylinders and Disks	8
1.6. Instability of Rotating Inhomogeneous Cylinders with Oppositely Directed Beams of Equal Density	9
§ 2. Gradient Instabilities of a Gravitating Medium	11
2.1. Cylinder of Constant Density with Radius-Dependent Temperature. Hydrodynamical Instability	11
2.2. Cylinder of Constant Density with a Temperature Jump. Kinetic Instability	13
2.3. Cylinder with Inhomogeneous Density and Temperature	14
§ 3. Hydrodynamical Instabilities of a Gravitating Medium with a Growth Rate Much Greater than that of Jeans	16
3.1. Hydrodynamical Instabilities in the Model of a Flat Parallel Flow	16
3.2. Hydrodynamical Instabilities of a Gravitating Cylinder	21

§ 4. General Treatment of Kinetic Instabilities	25
4.1. Beam Effects in the Heterogeneous Model of a Galaxy	26
4.2. Influence of a "Black Hole" at the Center of a Spherical System on the Resonance Interactions Between Stars and Waves	29
4.3. Beam Instability in the Models of a Cylinder and a Flat Layer	32
 CHAPTER VII	
Problems of Nonlinear Theory	37
§ 1. Nonlinear Stability Theory of a Rotating, Gravitating Disk	37
1.1. Nonlinear Waves and Solitons in a Hydrodynamical Model of an Infinitely Thin Disk with Plane Pressure	37
1.2. Nonlinear Waves in a Gaseous Disk	43
1.3. Nonlinear Waves and Solitons in a Stellar Disk	49
1.4. Explosive Instability	55
1.5. Remarks on the Decay Processes	56
1.6. Nonlinear Waves in a Viscous Medium	57
§ 2. Nonlinear Interaction of a Monochromatic Wave with Particles in Gravitating Systems	62
2.1. Nonlinear Dynamics of the Beam Instability in a Cylindrical Model	62
2.2. Nonlinear Saturation of the Instability at the Corotation Radius in the Disk	74
§ 3. Nonlinear Theory of Gravitational Instability of a Uniform Expanding Medium	80
§ 4. Foundations of Turbulence Theory	83
4.1. Hamiltonian Formalism for the Hydrodynamical Model of a Gravitating Medium	83
4.2. Three-Wave Interaction	91
4.3. Four-Wave Interaction	99
§ 5. Concluding Remarks	102
5.1. When Can an Unstable Gravitating Disk be Regarded as an Infinitesimally Thin One?	102
5.2. On Future Soliton Theory of Spiral Structure	108
Problems	110

## PART II

Astrophysical Applications	135
----------------------------	-----

### CHAPTER VIII

General Remarks	137
§ 1. Oort's Antievolutionary Hypothesis	138
§ 2. Is There a Relationship Between the Rotational Momentum of an Elliptical Galaxy and the Degree of Oblateness?	139
§ 3. General Principles of the Construction of Models of Spherically Symmetric Systems	141
§ 4. Lynden-Bell's Collisionless Relaxation	142
§ 5. Estimates of "Collisionlessness" of Particles in Different Real Systems	143

## CHAPTER IX

<b>Spherical Systems</b>	146
§ 1. A Brief Description of Observational Data	146
1.1. Globular Star Clusters	146
1.2. Spherical Galaxies	147
1.3. Compact Galactic Clusters	147
§ 2. Classification of Unstable Modes in Scales	147
§ 3. Universal Criterion of the Instability	148
§ 4. Specificity of the Effects of Small-Scale and Large-Scale Perturbations on the System's Evolution	149
§ 5. Results of Numerical Experiments for Systems with Parameters Providing Strong Supercriticality	150
§ 6. Example of Strongly Unstable Model	151
§ 7. Can Lynden-Bell's Intermixing Mechanism Be Observed Against a Background of Strong Instability?	153
§ 8. Is the "Unstable" Distribution of Stellar Density Really Unstable (in the Hydrodynamical Sense) in the Neighborhood of a "Black Hole"?	153

## CHAPTER X

<b>Ellipsoidal Systems</b>	158
§ 1. Objects Under Study	158
§ 2. Elliptical Galaxies	159
2.1. Why Are Elliptical Galaxies More Oblate than E7 Absent?	159
2.2. Comparison of the Observed Oblatenesses of S- and SO-Galaxies with the Oblateness of E-Galaxies	159
2.3. Two Possible Solutions of the Problem	159
2.4. The Boundary of the Anisotropic (Fire-Hose) Instability Determines the Critical Value of Oblateness	160
2.5. Universal Criterion of Instability	161
§ 3. SB-Galaxies	164
3.1. The Main Problem	164
3.2. Detection in NGC 4027 of Counterflows as Predicted by Freeman	164
3.3. Stability of Freeman Models of SB-Galaxies with Observed Oblateness	165

## CHAPTER XI

<b>Disk-like Systems. Spiral Structure</b>	166
§ 1. Different Points of View on the Nature of Spiral Structure	166
§ 2. Resonant Interaction of the Spiral Wave with Stars of the Galaxy	168
2.1. Derivation of Expressions for the Angular Momentum and Energy of the Spiral Wave	168
2.2. Physical Mechanisms of Energy and Angular Momentum Exchange Between the Spiral Waves and the Resonant Stars	177
§ 3. The Linear Theory of Stationary Density Waves	184
3.1. The Primary Idea of Lin and Shu of the Stationary Density Waves	184
3.2. The Spiral Galaxy as an Infinite System of Harmonic Oscillators	185
3.3. On "Two-Armness" of the Spiral Structure	187
3.4. The Main Difficulties of the Stationary Wave Theory of Lin and Shu	189

§ 4. Linear Theory of Growing Density Waves	197
4.1. Spiral Structure as the Most Unstable Mode	197
4.2. Gravitational Instability at the Periphery of Galaxies	199
4.3. Waves of Negative Energy Generated Near the Corotation Circle and Absorbed at the Inner Lindblad Resonance—Lynden-Bell—Kalnaj's Picture of Spiral Pattern Maintenance	202
4.4. Kelvin–Helmholz Instability and Flute-like Instability in the Near-Nucleus Region of the Galaxy as Possible Generators of Spiral Structure	204
4.5. The “Trailing” Character of Spiral Arms	206
§ 5. Comparison of the Lin–Shu Theory with Observations	213
5.1. The Galaxy	213
5.2. M33, M51, M81	216
§ 6. Experimental Simulation of Spiral Structure Generation	222
6.1. In a Rotating Laboratory Plasma	222
6.2. In Numerical Experiment	234
§ 7. The Hypothesis of the Origin of Spirals in the SB-Galaxies	237
CHAPTER XII	
Other Applications	239
§ 1. On the Structure of Saturn's Rings	239
1.1. Introduction	239
1.2. Model. Basic Equations	241
1.3. Jeans Instability	242
1.4. Dissipative Instabilities	243
1.5. Modulational Instability	253
Appendix. Derivation of the Expression for the Perturbation Energy of Maclaurin's Ellipsoid	258
§ 2. On the Law of Planetary Distances	261
§ 3. Galactic Plane Bending	265
3.1. Quasistationary Tidal Deformation	266
3.2. Free Modes of Oscillations	267
3.3. Close Passage	268
§ 4. Instabilities in Collisions of Elementary Particles	268
Appendix	271
§ 1. Collisionless Kinetic Equation and Poisson Equation in Different Coordinate Systems	271
§ 2. Separation of Angular Variables in the Problem of Small Perturbations of Spherically Symmetrical Collisionless Systems	275
§ 3. Statistical Simulation of Stellar Systems	277
3.1. Simulation of Stellar Spheres of the First Camm Series	277
3.2. Simulation of Homogeneous Nonrotating Ellipsoids	280
§ 4. The Matrix Formulation of the Problem of Eigenoscillations of a Spherically-Symmetrical Collisionless System	282
§ 5. The Matrix Formulation of the Problem of Eigenoscillations of Collisionless Disk Systems	291
5.1. The Main Ideas of the Derivation of the Matrix Equation	291
5.2. “Lagrange” Derivation of the Matrix Equation	292

§ 6. Derivation of the Dispersion Equation for Perturbations of the Three-Axial Freeman Ellipsoid	295
§ 7. WKB Solutions of the Poisson Equation Taking into Account the Preexponential Terms and Solution of the Kinetic Equation in the Postepicyclic Approximation	300
7.1. The Relation Between the Potential and the Surface Density	300
7.2. Calculations of the Response of a Stellar Disk to an Imposed Perturbation of the Potential	302
§ 8. On the Derivation of the Nonlinear Dispersion Equation for a Collisionless Disk	306
§ 9. Calculation of the Matrix Elements for the Three-Waves Interaction	314
§ 10. Derivation of the Formulas for the Boundaries of Wave Numbers Range Which May Take Part in a Decay	317
§ 11. Derivation of the Kinetic Equation for Waves	318
§ 12. Table of Non-Jeans Instabilities (with a Short Summary)	323
References	335
Additional References	349
Index	355
