

# Contents

Preface	vii
<b>1 Integration</b>	<b>1</b>
1.1 Classical Quadrature . . . . .	1
1.2 Orthogonal Polynomials . . . . .	9
1.2.1 Orthogonal Polynomials in the Interval $-1 \leq x \leq 1$ . . . . .	9
1.2.2 General Orthogonal Polynomials . . . . .	12
1.3 Gaussian Integration . . . . .	13
1.3.1 Gauss-Legendre Integration . . . . .	15
1.3.2 Gauss-Laguerre Integration . . . . .	16
1.4 Special Integration Schemes . . . . .	18
1.5 Principal Value Integrals . . . . .	19
<b>2 Introduction to Monte Carlo</b>	<b>25</b>
2.1 Preliminary Notions - Calculating $\pi$ . . . . .	25
2.2 Evaluation of Integrals by Monte Carlo . . . . .	27
2.3 Techniques for Direct Sampling . . . . .	28
2.3.1 Cumulative Probability Distributions . . . . .	29
2.3.2 The Characteristic Function $\phi(t)$ . . . . .	29
2.3.3 The Fundamental Theorem of Sampling . . . . .	30
2.3.4 Sampling Monomials $0 \leq x \leq 1$ . . . . .	30
2.3.5 Sampling Functions $0 \leq x \leq \infty$ . . . . .	33
2.3.6 Brute-force Inversion of $F(x)$ . . . . .	37
2.3.7 The Rejection Technique . . . . .	38
2.3.8 Sums of Random Variables . . . . .	39
2.3.9 Selection on the Random Variables . . . . .	41
2.3.10 The Sum of Probability Distribution Functions . . . . .	43
2.4 The Metropolis Algorithm . . . . .	46
2.4.1 The Method Itself . . . . .	47
2.4.2 Why It Works . . . . .	50
2.4.3 Comments on the Algorithm . . . . .	51

<b>3 Differential Methods</b>	<b>57</b>
3.1 Difference Schemes . . . . .	57
3.1.1 Elementary Considerations . . . . .	57
3.1.2 The General Case . . . . .	58
3.2 Simple Differential Equations . . . . .	60
3.3 Modeling with Differential Equations . . . . .	64
<b>4 Computers for Physicists</b>	<b>73</b>
4.1 Fundamentals	74
4.1.1 Representation of Negative Numbers . . . . .	75
4.1.2 Logical Operations . . . . .	77
4.1.3 Integer Formats . . . . .	78
4.1.4 Floating Point Formats . . . . .	79
4.2 The i8086 Series	81
4.2.1 The Stack	81
4.2.2 Memory Addressing . . . . .	82
4.2.3 Internal Registers of the CPU . . . . .	83
4.2.4 Instructions . . . . .	85
4.2.5 Sample Program . . . . .	91
4.2.6 The Floating Point Co-processor i8087 . . . . .	94
4.3 Cray-1 S Architecture . . . . .	95
4.3.1 Vector Operations and Chaining . . . . .	95
4.3.2 Coding for Maximum Speed . . . . .	97
4.4 Intel i860 Architecture . . . . .	98
<b>5 Linear Algebra</b>	<b>105</b>
5.1 $\chi^2$ Analysis	105
5.2 Solution of Linear Equations . . . . .	107
5.2.1 LU Reductions . . . . .	109
5.2.2 The Gauss-Seidel Method . . . . .	112
5.2.3 The Householder Transformation . . . . .	113
5.3 The Eigenvalue Problem . . . . .	117
5.3.1 Coupled Oscillators . . . . .	117
5.3.2 Finding the Eigenvalues of a Matrix . . . . .	118
5.3.3 Tridiagonal Symmetric Matrices . . . . .	121
5.3.4 The Role of Orthogonal Matrices . . . . .	123
5.3.5 The Householder Method . . . . .	125
5.3.6 The Lanczos Algorithm . . . . .	125

<b>6 Exercises in Monte Carlo</b>	<b>131</b>
6.1 The Potential Energy of the Oxygen Atom . . . . .	131
6.2 Oxygen Potential Energy with Metropolis . . . . .	134
6.3 Radiation Transport . . . . .	135
6.4 An Inverse Problem with Monte Carlo . . . . .	140
<b>7 Finite Element Methods</b>	<b>145</b>
7.1 Basis Functions – One Dimension . . . . .	146
7.2 Establishing the System Matrix . . . . .	148
7.2.1 Model Problem . . . . .	149
7.2.2 The “Classical” Procedure . . . . .	149
7.2.3 The Galerkin Method . . . . .	150
7.2.4 The Variational Method . . . . .	152
7.3 Example One-dimensional Program . . . . .	153
7.4 Assembly by Elements . . . . .	155
7.5 Problems in Two Dimensions . . . . .	156
7.5.1 Element Functions . . . . .	156
7.5.2 Poisson’s Equation . . . . .	158
<b>8 Digital Signal Processing</b>	<b>165</b>
8.1 Fundamental Concepts . . . . .	165
8.2 The Fast Fourier Transform . . . . .	168
<b>9 Chaos</b>	<b>175</b>
9.1 Functional Iteration . . . . .	176
9.2 Finding the Critical Values . . . . .	184
<b>10 The Schrödinger Equation</b>	<b>191</b>
10.1 Removal of the Time Dependence . . . . .	191
10.2 Reduction of the Two-body System . . . . .	192
10.3 Expansion in Partial Waves . . . . .	193
10.4 The Scattering Problem . . . . .	196
10.4.1 The Scattering Amplitude . . . . .	197
10.4.2 Model Nucleon-nucleon Potentials . . . . .	203
10.4.3 The Off-shell Amplitude . . . . .	207
10.4.4 A Relativistic Generalization . . . . .	213
10.4.5 Formal Scattering Theory . . . . .	214
10.4.6 Modeling the t-matrix . . . . .	215
10.4.7 Matching with Coulomb Waves . . . . .	217
10.5 Bound States of the Schrödinger Equation . . . . .	220
10.5.1 Nuclear Systems . . . . .	222
10.5.2 Physics of Bound States: The Shell Model . . . . .	222

10.5.3 Hypernuclei . . . . .	225
10.5.4 The Deuteron . . . . .	227
10.5.5 The One-Pion-Exchange Potential . . . . .	230
10.6 Properties of the Clebsch-Gordan Coefficients . . . . .	235
10.7 Time Dependent Schrödinger Equation . . . . .	237
<b>11 The N-body Ground State</b>	<b>247</b>
11.1 The Variational Principle . . . . .	248
11.1.1 A Sample Variational Problem . . . . .	250
11.1.2 Variational Ground State of the $^4\text{He}$ Nucleus . . . . .	252
11.1.3 Variational Liquid $^4\text{He}$ . . . . .	256
11.2 Monte Carlo Green's Function Methods . . . . .	259
11.2.1 The Green's Function Approach . . . . .	260
11.2.2 Choosing Walkers for MCGF . . . . .	268
11.3 Alternate Energy Estimators . . . . .	268
11.3.1 Importance Sampling . . . . .	269
11.3.2 An Example Algorithm . . . . .	272
11.4 Scattering in the N-body System . . . . .	274
11.5 More General Methods . . . . .	278
<b>12 Divergent Series</b>	<b>283</b>
12.1 Some Classic Examples . . . . .	283
12.2 Generalizations of Cesàro Summation . . . . .	285
12.3 Borel Summation . . . . .	287
12.3.1 Borel's Differential Form . . . . .	287
12.3.2 Borel's Integral Form . . . . .	290
12.4 Padé Approximates . . . . .	291
<b>13 Scattering in the N-body System</b>	<b>299</b>
13.1 Single Scattering . . . . .	299
13.2 First Order Optical Potential . . . . .	302
13.2.1 Calculating the Non-local Potential . . . . .	304
13.2.2 Solving with a Non-local Potential . . . . .	308
13.3 Double Scattering . . . . .	311
13.3.1 Relation of Double Scattering to Coherence . . . . .	315
13.4 Scattering from Fixed Centers . . . . .	317
13.5 The Watson Multiple Scattering Series . . . . .	321
13.6 The KMT Optical Model . . . . .	325
13.7 Medium Corrections . . . . .	326

<b>A Programs</b>	<b>335</b>
A.1 Legendre Polynomials . . . . .	335
A.2 Gaussian Integration . . . . .	336
A.3 Spherical Bessel Functions . . . . .	340
A.4 Random Number Generator . . . . .	343
<b>Index</b>	<b>345</b>
