Contents

1 Solution of Algebraic Equations When Auxiliary Conditions Are Specified 1

1. The Mixed Situation 1
2. The Auxiliary Conditions are Linear Constraints 4
3. Symmetry Conditions 7
4. Abridgment 8

Problems 9

2 Regarding Equilibrium Equations 12

1. Direct Algebraic Approach 12
2. Introduction of Auxiliary Variables; The Topological Approach 20
3. Introduction of Auxiliary Variables Through an Algebraic Approach 32
4. Parameter Matrices 39
5. Equilibrium Equations in Mixed Form 42
6. Accommodation of Multi-terminal Elements 46

Problems 47

3 Calculation and Characterization of Response 54

1. Piecewise Analysis of Networks 54
2. Determinant Evaluation in Terms of Link Sets or Tree Sets 55
3. Response Functions Directly Related to Branch Conductances 59

4. Definition of Network Response Functions 72
Problems 77

4 Synthesis of Networks from Given Parameter Matrices *80*

1. Realizability Conditions for an (n + 1)-Node Network 80
2. How to Grow a Tree from a Sign Matrix 87
3. (n + 1)-Node Realization Procedure for an nth-Order [G]-Matrix 88
4. Collateral Remarks Relative to Realization of the Matrix [G] 89
5. Synthesis Procedure when Several Node-Parameter Matrices Are Given 91
6. Realization of an nth-Order [G]-Matrix by a $2n$-Node Network 92
7. Realization of an Open-Circuit Resistance Matrix 103
8. Synthesis Procedure when Several Loop-Parameter Matrices Are Given 113
9. An Alternate Method of Synthesis for *RLC* Networks from Given Parameter Matrices 115

Problems 119

5 Power and Energy Relations *122*

1. The Energy Functions Associated with Linear Networks 122
2. The Quasi-Orthogonality of Voltage and Current Sources 127
3. The Transformation of Quadratic Forms 128
4. Condition for Positive Definiteness 130
5. Energy Functions in the Sinusoidal Steady State 132
6. Lagrangian Equations 135
7. Equilibrium Equations Are the Result of a Minimum Energy Principle 137

Problems 141

6 Consideration of Linear Active and Nonbilateral Elements *144*

1. Introductory Remarks 144
2. Characterization of Active and/or Nonbilateral Devices 145
3. Definition of Active and/or Nonbilateral Devices 150
4. Methods of Active Circuit Analysis 153

Problems 156

7 Natural Frequencies and Normal Coordinates *159*

1. The Frozen Distribution at Resonance 159
2. Normal Coordinates 165

3. A Useful Geometrical Interpretation for Normal Coordinates and Network Response 174
4. Prediction of the Number of Natural Frequencies 181
5. Equivalent Networks 190
6. Construction of Parameter Matrices from Given Response Functions 198
7. Networks with Embedded Active Devices 203
8. Transformation Theory Applied to Active and Nonbilateral Networks 206

Problems 213

8 The Impedance or Admittance Concept *217*

1. Basic Definition of the Admittance Function; Forced Behavior 217
2. Natural Behavior and the Complete Response 220
3. Impedances in Terms of Energy Functions; p.r. Character 222
4. Loci of Constant Real and Imaginary Parts near a Pole or Zero of Finite Order 226
5. Properties of Driving-Point and Transfer Impedances 232
6. Two-Element-Kind Driving-Point Impedances; the Hurwitz Test 236
7. Construction of Impedance Functions by Inspection 239

Problems 246

9 Response in the Frequency Domain *249*

1. *s*-Plane Geometry; Residue and Resonance Evaluation 249
2. Minimum-Reactive and Minimum-Phase Functions; Real-Part Sufficiency 252
3. Potential-Theory Analogies; Logarithmic and Dipole Potentials 255
4. Conformal Transformations and Some Useful Pole-Zero Configurations 264
5. Frequency Transformations 272

Problems 278

10 Response in the Time Domain *281*

1. The Transform Concept; Time-Domain Response in Closed Form 281
2. Elementary Properties of the Solution; TD-FD Correlations 290
3. Asymptotic Behavior and Moment Conditions 293

4. Some Rational Approximants for the Delay Factor e^{-st_0} 295
Problems 300

11 Time- and Frequency-Domain Correlation for Periodic Functions Through Fourier Analysis *304*

1. Boundary-Value Problems and the Expansion of An Arbitrary Function in a Series of Normal Functions 304
2. Representation of a Periodic Time Function by a Fourier Series 309
3. The Mean-Square-Approximation Property 312
4. Even and Odd Time Functions 315
5. The Phase Angles of the Harmonic Components 316
6. Even and Odd Harmonics 317
7. Amplitude and Phase Spectra 319
8. Useful Artifices in the Evaluation of Fourier Coefficients 322
9. A Criterion Regarding Asymptotic Convergence 328
10. Computation of Power and Effective Values 329

Problems 330

12 Time- and Frequency-Domain Correlation for Aperiodic Functions Through Fourier Analysis *334*

1. Frequency Groups and Interference Patterns 334
2. The Fourier Integral 340
3. Interpretation in the Complex Frequency Plane; the Laplace Transform 343
4. Some Interesting Interference Patterns 347
5. Elementary Properties of Fourier or Laplace Transforms 355
6. Asymptotic Behavior and Moment Conditions 361
7. The Family of Singularity Functions 363
8. Evaluation of Laplace Transforms on the *j*-Axis 369
9. Power Spectra and Parseval's Theorem 371

Problems 373

13 Convolution *377*

1. The Convolution Integral 377
2. Convolution with a Narrow Slit; the Scanning Concept 381
3. Convolution as a Superposition of Delayed Replicas 384
4. A Generalized Form of the Convolution Integral 385
5. Impulse-Train Methods of Evaluation 387
6. Considerations when One or Both Time Functions Are Periodic 393

7. Interpretation in the Frequency Domain 395
8. Convolution in the Frequency Domain 396
9. Commutability of Convolution and Multiplication by an Exponential 398
Problems 399

14 Approximation and Convergence Properties of the Fourier Series or Integral *402*

1. The Dirichlet Kernel and the Gibbs Phenomenon 402
2. Cesàro and Other Types of Summation or Truncation 408
3. The Problem of Optimum Truncation; Uniqueness of the Fourier Transform 411
4. The Fourier Series as a Special Form of the Laurent Expansion 414
Problems 421

15 Sampled and Band-Limited Functions *424*

1. The Concept of a Sampled Function 424
2. The Uniform Impulse Train and Its Spectrum 427
3. The Spectrum of a Sampled Time Function or Vice Versa 428
4. Relation to Fortescue's Symmetrical Coordinates 432
5. Transition from Fourier Series to Fourier Integral Reconsidered 438
6. Sampling and Lowpass Filtering of a Time Function; the Nyquist Sampling Theorem 440
7. Spectrum Truncation in the Case of an Infinite Uniform Impulse Train and Results Related Thereto 442
8. Approximation by a Sum of sin x/x Functions and the Lagrangian Interpolation Formula 447
9. Convolution of Impulse Trains is Like Polynomial Multiplication 448
Problems 450

16 Network Response by Fourier Methods *452*

1. Rational Transforms and Exponential Time Functions 452
2. Response of a Lumped Linear Network to a Suddenly Applied Exponential Excitation; the Dominance Requirement 457
3. The Excitation and the Network Are Arbitrary; Time- and Frequency-Domain Characterization of a Linear System 463
4. System Function Defined by the Convolution Integral 465
5. Real-Part Sufficiency 467
6. Condition for Facsimile Reproduction of Signals 469

7. The Output Is a Sum of Delayed Replicas of Either the Excitation or the Impulse Response 472
8. The Excitation Function Is Periodic over the Infinite or Semi-Infinite Time Domain 474
9. Response of an Ideal Filter 478
10. The Relative Importance of Amplitude and Phase Distortion in Practical Circuits 481
11. Compatibility of Amplitude and Phase Functions for Physical Networks 484
12. A Filter That Is Ideal with Respect to Its Time-Domain Response 485
13. Signal Delay in the Presence of Simultaneous Amplitude and Phase Distortion 486
14. "Simile" Transforms 491

Problems 494

17 Numerical Methods in Fourier Analysis and Synthesis *498*

1. Introductory Remarks 498
2. Forms for the Fourier Integrals Appropriate to Impulse-Train Methods of Evaluation 500
3. The Approximation Problem and Associated Error Criterion 502
4. Direct and Inverse Transforms by Impulse-Train Methods 509
5. The Moment Conditions 510
6. Truncation Error Evaluation 515
7. Determination of Impulse Response from Specified Input and Output Time Functions 519
8. Examples of Numerical Transform Evaluation and Error Control 526

Problems 533

18 Hilbert Transforms *536*

1. Potential Theory and Conjugate Functions 536
2. Derivation of Hilbert Transforms Using the Conjugate of an Impulse 539
3. Derivation Using Convolution with the Transform of a Unit Step 540
4. Alternative Forms 541
5. Use of Impulse-Train Techniques 542
6. Examples 544
7. Derivation and Generalization of the Hilbert Transform Using Cauchy's Integral Formula 552

8. The Paley-Wiener Criterion for an Attenuation Function and a Corresponding One for Phase 556
9. Evaluation of the Hilbert Transform for a Rational Function 559
10. The Resistance-Integral Theorem; Its Variants and Applications 561
Problems 580
