6 Models based on second order difference equations 1

6.1 *Some origins of maps in* R^2: Delayed and coupled logistic maps; Poincaré surface of section in extended phase space ($R^2 \times I$); area-preserving maps; nonconservative *vs* conservative maps; Levinson–Smith relaxation oscillator; Hénon and Heiles Hamiltonian 1

6.2 *Rotation and winding numbers*: Maps and flows; knots, algebraic constants of the motion 9

6.3 *The Cartwright–Littlewood, Levinson and Levi analyses*: The extraordinary family of solutions, K_0, of the forced self-exciting oscillator; equivalence to Bernoulli sequences; Levi's extensions 16

6.4 *Some abstract nonconservative maps in* R^2: Hénon's map; strange attractor; contracting map; geometrically wild *vs* dynamically-wild sets; Lyapunov exponents; period-three does not imply chaos in R^2; a fractal boundary between basins of attraction; Julia and Mandelbrot sets; Newton map 22

6.5 *The standard map; twist maps*: Ball on a vibrating plate; the microtron accelerator; harmonic lattice in a periodic potential; toroidal magnetic fields; twist maps; characteristic multipliers 33

6.6 *'Near-integrable' systems*: Poincaré's last geometric theorem; hyperbolic and elliptic fixed point pairs; stable and unstable manifolds; homoclinic and heteroclinic points; KAM surfaces; Poincaré's chaotic tangle; Bernoulli sequence 41

6.7 *The breakup of KAM curves*: Small divisors, irrational rotation numbers; computer study; continued fraction representation; the standard map and the golden mean 57

6.8 *Physical regularity in mathematical chaos*: Chaotic magnetic field lines and differentiable magnetic fields 65

6.9 *Chirikov's resonance-overlap criterion*: A periodically kicked oscillator example 67

6.10 *The numerical Poincaré map and discontinuous dynamics*: Hénon's integration method 72

6.11 *The Hénon–Heiles and Toda–Hamiltonian systems*: Poincaré maps for a nonintegrable and integrable system 74

6.12 *Abstract area-preserving maps on R^2 and T^2*: Hénon's map; involutive maps; Arnold's cat map; mixing 80
6.13 *Maps of sets*: The folds and kinks of a periodically forced conservative oscillator 90
6.14 *Maps on a lattice*: Rannou's study of the standard map and generalization on a $N \times N$ lattice; the random-map ensemble; Arnold's cat map on a lattice; short Poincaré recurrence; ghosts 93
6.15 *Dynamic entropies and information production*: The shuffling of partitions in phase space; Kolmogorov–Sinai, and topological dynamic entropies; informational interpretation 101
6.16 *Epilogue*: order–order, order–chaos, chaos–chaos in the house! 118

7 Models based on third order differential systems 125
7.1 *Linear third order equations*: Characterization of fixed points; stable, unstable, and center manifolds; various representations of flows 126
7.2 *Nonlinear flows*: Center cycles, saddle cycles; Poincaré's first return map; local Möbius band manifolds; some 'interacting' flows from neighboring saddle-nodes, or spiral nodes 132
7.3 *The Lorenz model*: Historical origin; bifurcation of the fixed points as a function of r; contracting and global attracting character 138
7.4 *Lorenz chaotic dynamics*: The Lorenz 'map'; the Lorenz fractal 'mask', a strange attractor 145
7.5 *A 'Lorenz-dynamic' fluid system*: A fluid flow in circular tubes which obeys the Lorenz equations 151
7.6 *Dynamo dynamics*: The amazing dynamics of the Earth's magnetic field; a physically unrelated simple disk dynamo with similar chaotic dynamics (a Lorenz system) 155
7.7 *The Lorenz homoclinic and heteroclinic bifurcations*: The global topological properties of the flow, for r above the first homoclinic bifurcation, and below the first heteroclinic bifurcation – a highly convoluted picture; 'preturbulence'. 162
7.8 *The Lorenz–Hopf bifurcation*: The subcritical bifurcation 177
7.9 *Lorenz dynamics for various parameter values*: Stable limit cycles subharmonic (saddle-node) bifurcations; Möbius strips and knotted limit cycles; intermittencies; bistabilities; and much chaos! 178
7.10 *The Lyapunov exponents*: Definition and methods of obtaining them; application to the Lorenz system, and bistability 190
7.11 *Rössler's models*: The 'lifting' approach to modeling; model $R1$, Lyapunov exponents, Poincaré maps, Lorenz 'maps' and Cantor set; the 'walking stick' folding and second Cantor set; subharmonic bifurcations, largest Lyapunov exponent; 'funnel' attractor; phase coherence; the 'Dali' limit cycle; model $R2$, bistability chaos; the taffey-machine-on-a-lazy-susan flow 198
7.12 *Lyapunov exponents and the dimension of a strange attractor*: A heuristic discussion of possible relations; the Kaplan–Yorke conjecture 217
7.13 *Open systems – chemical oscillations*: The Belousov–Zhabotinskii discoveries; the Field–Noyes 'Oregonator' equations; relaxation oscillations 222

8 'Moderate-order' systems 231

8.1 *Linear systems*: Poincaré's variational equations; near fixed points, asymptotic properties (Lyapunov exponents), with periodic and quasi-periodic coefficients; lattice normal modes and Schrödinger's solution 232

8.2 *Turing's linear chemical morphogenesis system*: Instabilities in cellular chains which are coupled diffusively 240

8.3 *'Integrable' Hamiltonian systems*: Motion on an n-dimensional torus; separation of adjacent states 246

8.4 *The Kolmogrov–Arnold–Moser theorem*: 'Near-integrable' systems 253

8.5 *Poincaré's and Fermi's theorems; Arnold diffusion.* 256

8.6 *The Fermi–Pasta–Ulam phenomenon and equipartitioning*: The nonequipartitioning of energy; early example of 'synergetics'; equipartitioning *vis-à-vis* ergodicity; influence on irreversibility (lattice heat conduction) 259

8.7 *Molecular models*: Polynomial potentials; Toda's exponential potential 268

8.8 *Toda's solitary waves in a lattice*: Analytic solutions for one and two 'conserved' compression pulses; cnoidal waves 274

8.9 *The dynamics of various Toda lattices*: The Ford–Stoddard–Turner numerical prediction of the integrability of equal-mass Toda lattices; the Flaschka and Hénon integrals; 'physical' significance? diatomic Toda lattices ($1 \geqslant m_1/m_2 \geqslant 0$); influence on chaotic behavior and lattice heat conduction 281

8.10 *The Painlevé property and integrability conjecture*: Kovalevskaya's use of complex time to search for integrability 294

8.11 *Chemical oscillations and dissipative open-system structures*: The 'Brusselator' and diffusively coupled Brusselators (Turing structures) 304

8.12 *Smale's analysis of Turing's morphogenic system*: Generating 'life' from 'dead' components, using diffusion; global aspects 311

8.13 *Embedding the dynamics of high-order dissipative systems in lower dimensional R^n*: The method of Takens and Crutchfield, Farmer, Packard, and Shaw; torus-knot example; application to chemical oscillations and Taylor vortices 317

8.14 *Some dynamics of living systems*: Definition problems; Eigen and Schuster's hypercycle quasi-species, error catastrophe; replicator equations; mean fitness; general Lotka–Volterra equation; Hofbauer's theorem, topological orbital equivalence; Smale's observation 330

8.15 *Epilogue*: open systems; open sesame! 343

9 Solitaires: solitons and nonsolitons 348

9.1 *The continuum limit of lattices and 'solitaire' solutions* 350

9.2 *Riemann invariants and the Korteweg–de Vries (KdV) equation* 358

9.3 *A comparison of the Burgers and KdV equations*: Dissipation *vs* dispersion 361

9.4 *The exact solution of Burgers equation – The Hopf–Cole transformation* 365

9.5 *A brief history leading to the inverse scattering transform (IST)*: Zabusky and Kruskal's discovery of 'solitons'; conservation laws; Miura's transformation; the 'Schrödinger equation' 367

9.6 *The general solution of the KdV equation*: Gardner–Green–Kruskal–Miura analysis; the Gel'fand–Levitan theorem; the inverse scattering transform 373
9.7 *Pure soliton solutions*: KdV equation; the Landau–Lifshitz subset 381
9.8 *The Lax formulation*: The KdV example 387
9.9 *The sine–Gordon equation*: Kinks; topological solitons; breather modes 390
9.10 *Hirota's 'direct method' in soliton theory*: Hirota's binary operators; nonlinear transformations (types A, B, and C); bilinear differential equation and special exact solution 398
9.11 *The AKNS formulation of the IST*: Ablowitz–Kaup–Newell–Segur extension of Zaharov and Shabat's method; connection of IST general solutions with the sine–Gordon, sinh–Gordon, nonlinear Schrödinger, modified KdV, and Dym's equations 406
9.12 *Some Bäcklund transformations between difference equations*: Bäcklund transformation; integrability condition; examples 410
9.13 *Invariant Bäcklund transformations*: Free parameter; nonlinear superposition; Riccati equation 413
9.14 *Infinite number of conservation laws*: Relationship to invariant Bäcklund transformation 418
9.15 *Onward*: Higher dimensions; resonant interactions 420

10 Coupled maps (CM) and cellular automata (CA) 427
10.1 *An overview*: Lagrangian and Eulerian models, with continuous and discrete variables and functions 427
10.2 *Some coupled maps (CM)*: Diffusive, and other coupling of cells obeying logistic-map dynamics; multiple-periodic regions; coexistence of many periods; 'semi-periodic turbulence'; spatial-temporal intermittency; inhomogeneous CM 431
10.3 *Coupled lattice maps (CLM = CA)*: General family; chemical turbulence model of Oono and Kohmoto; 'turbulence', 'solitons' and periodic space-time patterns; nonperiodic, excitable cells, diffusively coupled; bistable cells 445
10.4 *General cellular automata (CA)*: Von Neumann's question; Ulam's suggestion; dynamics defined 454
10.5 *'Legal' cellular automata*: Quiescent and symmetry conditions 457
10.6 *A general association for legal CA*: Some possible physical relations to CA rules, states and configurations 459
10.7 *Simple examples*: 'Self-reproduction' 460
10.8 *Neighborhood configurations and dynamic rules*: Rule number; 'totalistic' CA 462
10.9 *Several classifications of CA dynamic properties*: Four qualitative categories of dynamics 464
10.10 *Entropies of one-dimensional CA*: Some possibilities and shortcomings of entropy measurements of 'chaos' or 'turbulence' 473
10.11 *Particle-like dynamics from partial CA rules*: Colliding 'particles' with and without delays; oscillating 'molecule' 478
10.12 *Two-dimensional CA*: Von Neumann neighborhoods; Fredkin's 'self-reproducing' rule 482

10.13 *Garden-of-Eden configurations*: Configurations which cannot dynamical arise; Moore's theorem 484
10.14 *J.H. Conway's 'Life'*: Moore neighborhood; snakes, ponds, blinkers, beehives, barges, barberpoles, eaters, gliders and glider guns 487
10.15 *Excitable medium*: Quiescent, excited, and refractory states 491
10.16 *Invertible CA and physical dynamics*: Invertible *vis-à-vis* reversible dynamics; the description of nature, how can it best be achieved? 493
Appendix: von Neumann's questions 499
Epilogue: 'Understanding' complex systems: Order; organization; Endnote–models, causality, irreversibility 505

Appendixes
J On the Cartwright–Littlewood and Levinson studies of the forced relaxation oscillator 529
K Smale's horseshoe map 539
L Notes on the Kolmogorov–Arnold–Moser theorem 543
