Introduction 1

I GLOBAL WEAK SOLUTIONS

1. Problem Formulations and Uniqueness for Dissipative Parabolic Models

1.0 Introduction 11
1.1 Heat Conduction with Change of Phase: Stefan Problems 12
1.2 Unsaturated Fluid Infiltration in Porous Media 20
1.3 Reaction–Diffusion Systems 25
1.4 Incompressible, Viscous Fluid Dynamics at Constant Temperature: Navier–Stokes Equations and Generalizations 32
1.5 Uniqueness of Solutions 39
1.6 Bibliographical Remarks 42
References 43

2. Convergent Regularizations and Pointwise Stability of Implicit Schemes

2.0 Introduction 45
2.1 Regularization in the Stefan Problem 46
2.2 Semidiscrete Regularization and Maximum Principles in the Stefan Problem 52
2.3 Regularization in the Porous-Medium Equation 62
2.4 Nonnegative Semidiscrete Solutions of the Porous-Medium Equation and Maximum Principles 66
2.5 Invariant Rectangles and Maximum Principles for Reaction–Diffusion Systems in Semidiscrete Form 68
2.6 Bibliographical Remarks 73
References 74

3. Nonlinear Elliptic Equations and Inequalities

3.0 Introduction 76
3.1 General Operator Results in Banach Spaces and Ordered Spaces 77
3.2 Applications and Examples 89
3.3 Semidiscretizations Defined by Quadrature 99
3.4 Bibliographical Remarks 109
References 111

4. Numerical Optimality and the Approximate Solution of Degenerate Parabolic Equations

4.0 Introduction 113
4.1 Representations of Sobolev-Type and Upper-Bound Estimates 115
4.2 Lower-Bound Estimates and N-Widths 126
4.3 Convergence Rates for the Continuous Galerkin Method 142
4.4 Convergence Rates for Semidiscrete Approximations 154
4.5 Bibliographical Remarks 158
References 159

5. Existence Analysis via the Stability of Consistent Semidiscrete Approximations

5.0 Introduction 162
5.1 Stability in Sobolev Norms for Semidiscretizations of Degenerate Parabolic Equations 163
5.2 Existence of Weak Solutions for the Stefan Problem and the Porous-Medium Equation and Approximation Results 177
5.3 Existence for Reaction–Diffusion Systems 190

5.4 Existence for the Generalized Form of the Navier–Stokes Equations for Incompressible Fluids 195
5.5 Bibliographical Remarks 197
References 201

II LOCAL SMOOTH SOLUTIONS

6. Linear Evolution Operators

6.0 Introduction 207
6.1 Semigroup Preliminaries 208
6.2 The Linear Evolution Equation and Evolution Operators 213
6.3 Perturbations of Generators and Regularity of Evolution Operators 223
6.4 The Inhomogeneous Problem and an Application to Linear Symmetric Hyperbolic Systems 230
6.5 Bibliographical Remarks 235
References 235

7. Quasi-linear Equations of Evolution

7.0 Introduction 237
7.1 Perturbation of the Linear Problem and Nonlinear Preliminaries 238
7.2 The Quasi-linear Cauchy Problem in Banach Space 241
7.3 Quasi-linear Second-Order Hyperbolic Systems 247
7.4 The Vacuum Field Equations of General Relativity 257
7.5 Invariant Time Intervals for the Artificial Viscosity Method 262
7.6 Bibliographical Remarks 271
References 272

Subject Index 275
