1. Chaos, Order, Patterns, Fractals—An Overview	1
<i>S. Lundqvist</i>	
1.1. Introduction	1
1.2. Classical Dynamical Systems	2
1.3. Some Simple Examples	4
1.3.1. The Simple Pendulum	4
1.3.2. The Damped Oscillator	5
1.3.3. Oscillator with Nonlinear Damping	5
1.3.4. The Parametrically Driven Oscillator	7
1.4. Simple Systems with Two Degrees of Freedom	7
1.4.1. Hamiltonian System with Two Frequencies	7
1.4.2. A Perturbed Hamiltonian System	8
1.4.3. Poincaré Maps	8
1.4.4. Two Coupled Harmonic Oscillators	9
1.5. Dissipative Systems with Two Frequencies	10
1.5.1. The Driven Damped Oscillator	10
1.5.2. Josephson Junction in a Microwave Field	10
1.5.3. A Charge Density Wave in an Electric Field	11
1.5.4. Phase Locking. The Circular Map	11
1.6. Systems Described by Partial Differential Equations	13
1.7. Some Basic Properties of Chaotic Systems	17
1.7.1. Chaos in Poincaré Maps	17
1.7.2. Chaos as Seen Directly in the Signal	18
1.7.3. The Power Spectrum	18
1.7.4. The Autocorrelation Function	19
1.8. Some Different Routes to Chaos	20
1.9. Some Comments about Attractors	21
1.9.1. Introductory Remarks	21
1.9.2. Some Properties of Attractors	23

1.10. Fractals	24
1.10.1. Introductory Remarks	24
1.10.2. The Fractal Dimension	25
1.10.3. The Cantor Set ($0 < D < 1$)	26
1.10.4. The Koch Curve ($1 < D < 2$)	27
1.10.5. Fractal Lattices and Nets. The Menger Sponge ($2 < D < 3$)	28
1.11. Examples of Strange Attractors	28
1.12. More about Maps	30
1.12.1. A Very Simple Model	31
1.12.2. Mapping a Baker's Work	33
1.12.3. Some Final Remarks about Fishing	34
References	36
2. An Introduction to the Properties of One-Dimensional Difference Equations	39
<i>G. Rowlands</i>	
2.1. Introduction	39
2.2. Linear Difference Equations	40
2.3. The Logistic Equation	42
2.4. Universality	58
2.5. Summary	61
References	62
3. Spectral Transform and Solitons: How to Solve and Investigate Nonlinear Evolution Equations	63
<i>F. Calogero and A. Degasperis</i>	
3.1. Introduction	63
Notes to Section 3.1	65
3.2. The Main Idea and Results: An Overview	66
3.2.1. Solution of Linear Evolution Equations by Fourier Transform	66
3.3. A Class of Solvable Nonlinear Evolution Equations	73
3.4. The Spectral Transform	74
3.4.1. Direct Spectral Problem	75
3.5. Inverse Spectral Problem	76
3.6. Discussion of the Spectral Transform	79
3.7. Solution of Nonlinear Evolution Equations via the Spectral Transform	81
3.8. Relation to the Fourier Transform Technique to Solve Linear Evolution Equations	84

3.9. Qualitative Behavior of the Solutions: Solitons and Background	86
3.9.1. Solitons	86
3.9.2. Background	90
3.9.3. Generic Solution	91
3.10. Additional Properties of the Solutions	92
3.10.1. Bäcklund Transformations	92
3.11. Nonlinear Superposition Principle	98
3.12. Conservation Laws	100
3.13. A List of Solvable Equations	105
Notes to Chapter 3	119
References	123

4. Homogeneous Isothermal Oscillations and Spatiotemporal Organization in Chemical Reactions **139**

P. De Kepper

4.1. Introduction	139
4.2. Brief Historical Survey of Homogeneous Liquid-Phase Oscillating Reactions	140
4.3. Temporal Behavior	144
4.3.1. Batch Experiments	144
4.3.2. Flow Reactor Experiments	144
4.3.3. Aperiodic Oscillations or "Chemical Chaos"	151
4.4. Design of Chemical Oscillators	155
4.5. Spatial Organization	157
4.5.1. Introduction	157
4.5.2. Propagating Waves	158
4.5.3. Unmoving Mosaic Structures	160
4.6. Conclusion	161
Appendix	162
References	163

5. Synergetics—From Physics to Biology **167**

H. Haken

5.1. The Developing World of Physics	167
5.2. The Laser Paradigm	169
5.3. Relations to Other Concepts	175
5.4. Synergetics	180
5.5. Some Examples from Physics and Chemistry	184
5.6. Modeling of Complex Systems by Means of the Order Parameter and Slaving Concepts: An Example from Biology	185
Recommended Reading	192

6. Instabilities and Chaos in Lasers: Introduction to Hyperchaos	193
<i>F. T. Arecchi</i>	
6.1. Introduction	193
6.2. Deterministic Chaos	194
6.2.1. Historical Aspects	194
6.2.2. Dynamical Aspects	195
6.3. Information Aspects	198
6.4. The Modulated Laser	201
6.5. The Laser with Injected Signal	209
6.6. The Laser with Feedback	211
6.7. The Bidirectional Ring Laser	212
6.8. Noise-Induced Trapping at the Boundary between Two Attractors: Hyperchaos and $1/f$ Spectra	217
6.9. Conclusion: Long Memory in Statistical Physics	222
References	223
7. Nonlinear Optics of Bistability and Pulse Propagation	225
<i>R. Loudon</i>	
7.1. Introduction	225
7.1.1. Linear Susceptibility	226
7.1.2. Nonlinear Susceptibility	227
7.2. Optical Bistability and Laser Action	229
7.2.1. Saturable Absorption	229
7.2.2. Fabry-Perot Cavity	232
7.2.3. Absorptive Optical Bistability	235
7.2.4. The Laser	237
7.2.5. Dispersive Optical Bistability	240
7.3. Optical Propagation in Nonlinear Fibers	242
7.3.1. Nonlinear Pulse Propagation	243
7.3.2. Group Velocity Dispersion	246
7.3.3. Self-Phase Modulation	247
7.3.4. Soliton Propagation	248
7.3.5. Optical Chaos in Ring Cavities	250
References	252
8. Electron and Phonon Instabilities	253
<i>P. N. Butcher</i>	
8.1. Introduction	253
8.2. The Effect of a Negative Differential Mobility	254

8.3. The Large Signal Form of the Gunn Effect Instability 256

8.4. Physical Mechanisms Which Determine the Shape of the Velocity-Field Characteristic 259

8.5. The Basic Equations of the Acoustoelectric Instability 261

8.6. The Small Signal Regime in a Piezoelectric Semiconductor 262

8.7. Solution of the Space Charge Equations for a Nonlinear Traveling Wave in a Piezoelectric Semiconductor 264

8.8. Nonlinear Acoustic Gain and Acoustoelectric Current 268

8.9. Conclusion 273

References 274

9. Fractals in Physics: Introductory Concepts 277

L. Pietronero

9.1. Introduction 277

9.2. Self-Similarity and Nonanalyticity 279

9.3. Power Laws and Self-Similarity 282

9.4. Why Fractal Dimensions and Not Just Critical Exponents 285

9.5. Fractals and Multifractals 287

9.6. Laplacian Fractals 290

9.7. A Note about Experiments 292

References 294

10. Phase Transitions 295

R. B. Stinchcombe

10.1. Introduction: Emphasis and Layout 295

10.2. Basic Considerations 296

 10.2.1. Ising Spin Systems: Ordering 297

 10.2.2. Ising Spin Systems: Phase Diagrams 298

 10.2.3. Correlation Functions, Correlation Length 298

 10.2.4. Definition of Critical Exponents 299

 10.2.5. Résumé of Basic Points 300

 10.2.6. Bose-Einstein Condensation 300

 10.2.7. Bond Percolation 301

10.3. Geometric Viewpoints 302

 10.3.1. Ground State and Other Configurations in Ising Systems 302

 10.3.2. Configurations at a Phase Transition; Scale Invariance 303

10.4. Investigation of Phase Transitions; Mean Field and Landau Theory, Fluctuations 305

 10.4.1. Mean Field Theory 306

10.4.2.	Landau Theory of Phase Transitions; Uniform Case; Bulk Properties, Exponents	307
10.4.3.	Landau Theory; Space Varying Case; Correlations	309
10.4.4.	Fluctuation Effects; Upper Critical Dimensionality	309
10.4.5.	Critique of Mean-Field Theory	310
10.5.	Review of Systems	311
10.6.	Critical Behavior: Exponents, Universality, Homogeneity	313
10.6.1.	Homogeneity Hypothesis, Exponent Relationships, and Dynamic Scaling	314
10.6.2.	Derivation of Exponent Relations from Homogeneity Hypothesis	315
10.7.	Self-Similarity, Controlling Length, Anomalous and Fractal Dimensions	316
10.7.1.	“Controlling Length” Interpretation of Homogeneity, Hyperscaling, and Criticality	316
10.7.2.	Anomalous and Fractal Dimensions, and Exponents	317
10.7.3.	Percolation Order Parameter and Fractal Dimension of Percolation Infinite Cluster	318
10.8.	Competition of Lengths; Crossover	319
10.8.1.	Crossover from Competition of Two Intrinsic Correlation Lengths	319
10.8.2.	Crossover and Scaling Forms Involving Extrinsic Lengths	320
10.9.	Length Scaling: Renormalization Group Transformation by Decimation or Blocking	321
10.9.1.	Decimation: Original and Scaled Systems Illustrated for Bond Percolation	322
10.9.2.	Decimation: “Renormalization Group Transformation” and Extraction of Critical Condition, Exponents	323
10.9.3.	Decimation: Results and Further Discussion	324
10.9.4.	Blocking: Original and Scaled Systems, Renormalization Group Transformation (Example: Site Percolation)	325
10.10.	Further Topics in Length Scaling: Flow, Universality; Transformation as Iterative Map; Fractals	327
10.10.1.	Extension of Parameter Spaces, Flow, Universality	327
10.10.2.	One-Parameter Transformation; Simple, Cyclic, and Chaotic Scalings; Discrete Scale Invariance, Fractals	328
10.11.	Length Scaling for Critical Dynamics of Chains and Fractals	330
10.11.1.	Length Scaling for Dynamics: Decimation for Simple Chain	331
10.11.2.	Extraction of Dynamic Critical Exponent, Dispersion Relation, Density of States, and Dynamic Response from Dynamic Length Scaling Transformation	332

10.11.3. Dynamic Properties of Fractals via Length Scaling (Decimation)	333
10.12. Anomalous Dynamics in Random Scale-Invariant Systems	334
10.12.1. Anomalous Dynamics in Diluted Spin Systems near the Percolation Threshold	335
References	337
11. Classical Chaos and Quantum Eigenvalues	341
<i>M. V. Berry</i>	
12. Renormalization Description of Transitions to Chaos	349
<i>P. Cvitanović</i>	
12.1. Introduction	349
12.2. Complex Universality	351
References	360
13. Order and Chaos in Hamiltonian Systems	361
<i>I. C. Percival</i>	
13.1. Survey of Modern Hamiltonian Dynamics	361
13.1.1. Regular and Chaotic Motion	361
13.1.2. Variational Principles	363
13.1.3. Static Model	364
13.1.4. Discrete Time	365
13.1.5. Vertical Pendulum and Standard Map	367
13.1.6. Static Models and Cantori	372
13.2. Hamiltonian Systems with m Degrees of Freedom	374
13.3. Chaotic Systems and Symbolic Dynamics (1)	375
13.3.1. Introduction	375
13.3.2. The Binary Map	375
13.3.3. The Baker's Transformation	377
13.3.4. Bernoulli Maps and Liapunov Exponents	380
13.4. Chaotic Systems and Symbolic Dynamics (2)	384
13.5. Transport	384
13.6. Conclusion—The Shift in Viewpoint	384
