Preface	vii
Contributors	x
1-1. The Unreasonable Effectiveness of Mathematics in the Natural Sciences / Eugene P. Wigner (reprint)	1
What is Mathematics? 2 What is Physics? 4 The Role of Mathematics in Physical Theories, 6 Is the Success of Physical Theories Truly Surprising? 7 The Uniqueness of the Theories of Physics, 10 Notes, 13 References, 14	
1-2. The Unreasonable Effectiveness of Mathematics / R.W. Hamming (reprint)	15
Prologue, 15 The Effectiveness of Mathematics, 17 What is Mathematics? 19 Some Partial Explanations, 24 Conclusion, 28 References, 29	
2. Gauge Invariance in Nature: A Simple View / Sylvester J. Gates, Jr.	31
Introduction, 32 Classical Electrodynamics and Gauge Invariance, 33 Quantum Mechanics and Gauge Invariance, 42 Relativistic Intermezzo, 50 Corpuscular Intermezzo, 58 Yang-Mills Theory: Exact and Broken, 62 Acknowledgments, 74 Bibliography, 75 Appendix A: The Dirac Equation, 75 Appendix B: Matrix Manipulation, 78	
3. The Radon Transform / Stanley R. Deans	81
Background, 82 Definitions, 83 Connection Between Spaces, 88 Properties, 91 Finding Transforms, 96 Inversion, 102 Symmetry and Related Transforms, 110 Series, 117 Applications, 119 Acknowledgments, 124 References, 124	
4. The Geometry of Quantum Flow / James V. Lindesay and Harry L. Morrison	135
Introduction, 135 Group Theoretic Considerations, 136 Systems with Local Internal Symmetries, 142 Application to Physical Systems, 145 A Simple Example, 160 Conclusions, 166 Acknowledgments, 166 References, 166	

5. Classical Chaos, the Geometry of Phase Space, and Semiclassical Quantization / William P. Reinhardt	169
Introduction and Phenomenology, 170 Expectations: Classical Chaos and the Correspondence Principle, 196 Chaos and the Fragmentation of Tori, 209 Semiclassical Quantization of Fragmented Tori, 222 Summary, 231 Acknowledgments, 232 Notes and References, 232	
6. The Adiabatic Method in the Theory of Many-Body Systems / Vladimir Z. Kresin and William A. Lester, Jr.	247
Introduction, 247 The Adiabatic Method in Solid State Theory and the Theory of Molecules, 248 Nuclear Dynamics, 276 Acknowledgments, 294 References, 294	
7. Catastrophe Theory: What It Is; Why It Exists; How It Works / Robert Gilmore	299
The Program of Catastrophe Theory, 300 Three Theorems of Elementary Calculus, 301 The List of Elementary Catastrophes, 305 Why a List of Perturbations is Required, 307 Geometry of Two Elementary Catastrophes, 311 Perturbation of Gradient Dynamical Systems, 320 Transformation to Canonical Form: A_3 , 321 The General Procedure, 325 Transformation to Canonical Form: $T_{3,3,3}$, 327 Catastrophe Conventions, 331 Catastrophe Flags, 333 Applications, 340 Conclusions, 354 Acknowledgments, 354 References, 355	
About the Editor	357
