CONTENTS

Preface ix

1 **Introduction** 1

References 8

2 **Differential equations, maps and asymptotic behaviour** 11

2.1 Time evolution and dynamical systems 11

2.2 Stationary points 16

2.3 Periodic oscillations 20

2.4 Asymptotic behaviour and chaotic attractors 25

2.5 Entropy, Lyapunov exponents, dimension and the effect of small random perturbations 36

References 48

3 **Transition from order to chaos** 51

3.1 Bifurcations of dynamical systems 51

3.2 Local bifurcations and dependence of solutions on a parameter 54

3.3 Bifurcations and chaos in one-dimensional maps 61

3.3.1 Period-doubling sequences and universality 64

3.3.2 The U-sequence 71

3.3.3 Chaotic behaviour 74

3.3.4 Intermittency 77

3.3.5 Crises and transient chaos 79

3.3.6 Circle maps 81

3.3.7 Transition from quasiperiodicity to chaos 85

3.3.8 Transition from phase-locked dynamics to chaos 88

3.4 Transition to chaos in multidimensional systems 90

References 99

4 **Numerical methods for studies of parametric dependences, bifurcations and chaos** 103

4.1 Continuation of periodic orbits and their bifurcations 104

4.2 Lyapunov exponents from mathematical models 109

4.3 Computation of Poincaré sections for continuous orbits 113

4.4 Reconstruction of attractors from experimental time series 114

4.5 Lyapunov exponents from time series 115

4.6 Dimensions and entropies of attractors 117

4.7 Power spectra 120

References 123

5 **Chaotic dynamics in experiments** 126

5.1 Introduction 126

5.2 Nonlinear circuits 128

5.2.1 Noise generator 128
5.2.2 Experiments on period-doubling 132
5.2.3 Other routes to chaos 135
5.3 Mechanical and electromechanical systems 148
5.4 Solid state systems 154
5.4.1 Semiconductors 154
5.4.2 Josephson junctions 159
5.5 Chaos in nonlinear optics 161
5.6 Chaos in chemical systems 165
5.6.1 Routes to chaos in the BZ reaction 168
5.6.2 U-sequence in the BZ reaction 169
5.6.3 Periodic-chaotic sequence 169
5.6.4 Chaotic oscillations in other chemical systems 174
5.7 Chaotic oscillations in biological systems 177
5.8 Transition to turbulence in hydrodynamics 179
5.8.1 Taylor-Couette flow 179
5.8.2 Rayleigh-Bénard convection 183
5.8.3 Other fluid-dynamic systems 188
References 190

6 Forced and coupled chemical oscillators – a case study of chaos 203
6.1 Periodically forced continuous stirred tank reactor 203
6.1.1 Single pulse experiments – phase transition curves 206
6.1.2 Experiments with periodic pulses 208
6.1.3 Geometrical models for PTCs 211
6.1.4 Iterated PTCs – model for periodic forcing 214
6.1.5 Numerical computations and comparison with experiments 217
6.2 Coupled reaction-diffusion cells 221
6.2.1 Model of two coupled reaction-diffusion cells 222
6.2.2 Stationary solutions 224
6.2.3 Classification of periodic solutions and their bifurcations 229
6.2.4 Dependence of periodic solutions on D_1 232
6.2.5 Behaviour of periodic solutions in the parameter plane (B, D_1) 239
6.2.6 Period-doublings and chaotic attractors 245
6.2.7 Intermittency, multiple attractor behaviour and crises 251
6.2.8. Lyapunov exponents, dimensions and power spectra 253
6.2.9 One-dimensional mapping 256
6.2.10 Transition from torus to chaos 257
6.2.11 Larger arrays of coupled cells 262
References 269

7 Chaos in distributed systems, perspectives 272
7.1 Introduction 272
7.2 Cellular automata 273
7.3 Coupled map lattices 274
7.4 Partial differential equations 278
7.5 Perspectives 283
References 285

Appendix A Normal forms and their bifurcation diagrams 289
A.1 Dynamical systems on a line 290
A.2 Dynamical systems on a plane 294
References 301

Appendix B CONT – a program for construction of solution and bifurcation diagrams 302

Index 363
