<i>Preface</i>	xiii
<b>I Nonlinear behavior in the physical sciences and biology: some typical examples.</b>	
1.1 What is nonlinearity?	1
1.2 Nonlinear behavior in classical mechanics	2
1.3 Thermal convection	5
1.4 Nonlinear phenomena in chemistry	12
1.5 Some further examples of chemically-mediated nonlinear behavior	19
Problems	23
<b>2 Quantitative formulation</b>	
2.1 Evolution equations in classical mechanics	25
2.2 The macroscopic level: balance equation of a macrovariable	29
2.3 Conserved variables in a one-component system and the equations of fluid dynamics	30
2.4 Nonconserved variables in a multicomponent system and the equations of chemical kinetics	33
2.5 The Bénard problem: quantitative formulation	35
2.6 Some representative chemical models giving rise to nonlinear behavior	40
Problems	45
<b>3 Dynamical systems with a finite number of degrees of freedom</b>	
3.1 General orientation	47
3.2 Phase space	49

---

3.3 Invariant manifolds	51
3.4 Conservative and dissipative systems. Attractors	58
3.5 Stability	61
3.6 The principle of linearized stability	66
Problems	69
<b>4 Linear stability analysis of fixed points</b>	
4.1 General formulation	71
4.2 Systems involving one variable	75
4.3 Systems involving two variables	77
4.4 Examples of stability analysis of two-dimensional dynamical systems	84
4.5 Three variables and beyond	87
Problems	92
<b>5 Nonlinear behavior around fixed points: bifurcation analysis</b>	
5.1 Introduction	94
5.2 Expansion of the solutions in perturbation series: the case of zero eigenvalue, $\text{Re } \omega_c = \text{Im } \omega_c = 0$	96
5.3 The amplitude equation: transcritical bifurcation	98
5.4 The amplitude equation: pitchfork bifurcation	102
5.5 Limit point bifurcation	104
5.6 Kinetic potential, sensitivity, structural stability	105
5.7 The Hopf bifurcation	110
5.8 Cascading bifurcations	114
5.9 Normal forms and resonances	120
Problems	125
<b>6 Spatially distributed systems, broken symmetries, pattern formation</b>	
6.1 General formulation	128
6.2 The Bénard problem: reference state and linearization of the Boussinesq equations	129
6.3 The Bénard problem: linear stability analysis for free boundaries	133
6.4 Reaction–diffusion systems. The Turing instability	138
6.5 Further comments on linear stability in spatially distributed systems	146
6.6 Bifurcation analysis: general formulation	148
6.7 Bifurcation of two-dimensional rolls in the Bénard problem: the small aspect ratio case	151

---

6.8	Bifurcation analysis in systems of large spatial extent: complex Landau–Ginzburg equation	156
6.9	Further examples of normal form envelope equations in large systems	161
	Problems	169
<b>7</b>	<b>Chaotic dynamics</b>	
7.1	The Poincaré map	173
7.2	One-dimensional recurrences: general aspects	178
7.3	Phenomenology of one-dimensional recurrences: illustrations	180
7.4	Tools of chaos theory	188
7.5	Routes to chaos: quantitative formulation	192
7.6	Fully developed chaos: probabilistic description	196
7.7	Error growth, Lyapunov exponents and predictability	205
7.8	The dynamics of symbolic sequences: entropy, master equation	211
7.9	Spatio-temporal chaos	220
	Problems	227
	<b>Appendices</b>	
A1	Proof of the principle of linearized stability for one-variable systems	230
A2	Hopf bifurcation analysis of the Brusselator model	234
