

Table of Contents

Preface	v
Chapter 1. Introduction	1
1.1: Summary and Motivation	1
1.2: Philosophical Approach	15
1.3: Guide for the Reader	19
1.4: Intuitive Discussion of the Conceptual Framework	23
1.4.1: The Analogy Between Entropy and Action	25
1.4.2: Adiabatic Invariants and Pseudo-forces	26
1.4.3: Symmetries and Exact Invariants	29
1.4.4: Thermodynamic Forces	30
1.4.5: Wave Action	31
1.4.6: Action, Entropy and Asymptotics	34
1.4.7: Steepest Descents, Stationary Phase, and Averaging	35
1.4.7.1: Resonance	36
1.4.8: The Key Examples in Mechanics, Waves, and Statistics	37
1.4.9: Mechanical Systems	38
1.4.10: Mechanical Systems: Separation of Time Scales	38
1.4.10.1: Gyromotion and Asymptotics	39
1.4.10.2: Oscillation Centers and Ponderomotive Forces	41
1.4.10.3: Geometric Perturbation Theory	42
1.4.11: Averaging in Statistical Systems	44
1.4.11.1: Matched Asymptotics	46

1.4.12: Averaging and Local Fourier Transforms	47
1.4.12.1: Scales in Differentiation	49
1.4.13: Symplectic Asymptotics in Thermodynamics and Mechanics . . .	50
1.5: A Hundred Further Questions, Conjectures, and Suggestions	56
PART I: MECHANICS	75
Chapter 2. Survey of Geometric Perturbation Theory	77
2.1: Historical Background	77
2.2: Geometric Perturbation Theory	82
2.2.1: Manifolds	82
2.2.2: Dynamical Systems	83
2.2.3: Perturbation Theory	84
2.2.4: First Order Perturbation Equations	89
2.2.5: Functions, Covectors, and Cotangent Bundles	90
2.2.6: Vectors and Tangent Bundles	90
2.2.7: The State Space for First Order Perturbation Theory	92
2.2.8: Flows and Derivatives	93
2.2.9: Dynamics for First Order Perturbation Theory	93
2.3: The Geometry of Jth Order Perturbation Theory	96
2.3.1: The Path Space	96
2.3.1.1: Spaces of Shorter Paths	98
2.3.2: The Space of Germs of Paths	99
2.3.3: The Space of Jets of Paths	101
2.3.3.1: Coordinates on the Jet Space	101

2.3.4: Tangent Vectors to Path Space	102
2.3.5: Tangent Vectors to the Quotient Spaces	104
2.3.5.1: Coordinates on the Tangent Bundle to the Jet Space	104
2.3.5.2: Coordinate Relation Between Path and Jet Vectors	105
2.3.6: Dynamics on Path Space	106
2.3.7: Dynamics on Jet Space	107
2.4: Geometric Hamiltonian Mechanics	109
2.4.1: Poisson Manifolds	110
2.4.2: Hamiltonians and Hamiltonian Vector Fields	111
2.4.3: Symplectic Manifolds	111
2.4.4: Symplectic Leaves and Bones and Casimir Functions	112
2.4.5: The Natural Symplectic Structure on Cotangent Spaces	112
2.5: Hamiltonian Systems with Symmetry	115
2.5.1: Generalized Noether's Theorem	116
2.5.2: Circle Actions	117
2.5.3: Reduction by a Circle Action	118
2.5.3.1: The Reduced Phase Space	118
2.5.3.2: The Reduced Hamiltonian	120
2.5.3.3: The Reduced Poisson Bracket	120
2.5.3.4: Coordinate Calculation of the Reduced Space	121
2.6: Example: Centrifugal Force	122
2.6.1: Angular Momentum Generates Rotations	122
2.6.2: The Reduced Space and Bracket	124

2.6.3: The Reduced Hamiltonian Gives Centrifugal Force	126
2.7: Higher Dimensional Symmetries	128
2.7.1: Hamiltonian Symmetry	128
2.7.2: The Momentum Map	129
2.7.2.1: Linear and Angular Momentum as Momentum Maps	130
2.7.3: Non-commutativity as the Obstruction to Reduction	130
2.7.4: The Adjoint and Coadjoint Actions	131
2.7.4.1: Equivariance of the Momentum Map	134
2.7.5: Multidimensional Reduction using a Coadjoint Isotropy Subgroup	135
2.7.6: Multidimensional Reduction using Coadjoint Orbits	136
2.7.7: The Lie-Poisson Bracket and Group Configuration Spaces	136
2.7.8: Euler's Equations for the Free Rigid Body	138
2.7.9: Euler's Equations for a Perfect Fluid	140
2.7.10: Gases and Plasmas	142
2.8: Geometric Hamiltonian Perturbation Theory	146
2.8.1: Linearized Dynamics at a Fixed Point from Jet Bracket	148
2.8.2: Symmetry and Perturbation Theory	151
2.9: The Method of Averaging for Hamiltonian Systems	153
2.9.1: Approximate Noether's Theorem	154
2.9.2: Hamiltonian Averaging as Reduction by a Circle Action	154
2.9.2.1: Averaging and the Jet Picture	156
2.9.2.2: Extensions from Loops to Tori and Energy Surfaces	157
2.9.3: Pseudo-Potentials and Adiabatic Invariants	158

2.9.3.1: Ping-pong balls and One-dimensional Gases	160
2.9.3.2: Oscillatory Stabilization	161
2.9.3.3: Multiple Space and Time Scales	162
2.10: Example: $E \times B$ Drift	165
Chapter 3. Pseudo-forces and Reduction	168
3.1: Pseudo-forces and Reduction	168
3.1.1: Fictitious Forces	169
3.1.2: Rotating Coordinates	170
3.1.3: Reduction of Simple Mechanical Systems	172
3.1.4: Circle Actions on Simple Mechanical Systems	174
3.1.5: Fictitious Forces as Reduction	175
3.1.6: Fictitious Forces with Momentum Shift as Reduction	177
3.2: Geometry of the Method of Variation of Parameters	180
3.2.1: Hamiltonian Variation of Parameters	182
Chapter 4. Hamiltonian Structures in Perturbation Theory	184
4.1: Introduction	184
4.2: First Order Hamiltonian Perturbation Theory	187
4.3: Path and Jet Spaces	194
4.3.1: Path Space Symplectic Structure and Hamiltonian	195
4.3.2: The Path Space Dynamics is Hamiltonian	195
4.4: Coordinate Description of the J-jet Structure	197
4.4.1: The Jet Hamiltonian	198
4.4.2: The Jet Poisson Bracket	198

4.5: Relation to the Iterated Tangent Bundle	199
4.5.1: Injecting Jets into the Iterated Tangent Bundle	199
4.5.1.1: Coordinate Description of the Injection	200
4.5.2: Symplectic Structure on the Iterated Tangent Bundle	201
4.5.2.1: Coordinate Description of Symplectic Structure	201
4.5.3: Pulled Back Symplectic Structure on the Jet Space	202
4.6: Relation to the Path Space Bracket	203
4.6.1: Weighted Path Bracket and Hamiltonian	203
4.6.2: Jet Bracket Arises from Derivative of Delta Function Weighting .	205
4.6.3: Jet Hamiltonian from Derivative of Delta Function Weighting . .	206
4.7: Jet Space as Derivative	207
4.7.1: The Sheet Quotient Spaces	207
4.7.2: Sheet Symplectic Structure and Hamiltonian	207
4.7.3: Map Between Sheet Space and Jet Space	208
4.7.4: The Pulled Back Sheet Symplectic Structure and Hamiltonian .	208
4.7.5: Sheet Structures Asymptote to Jet Structures for Small Spacing .	209
4.8: Jets and Symmetry	212
4.8.1: ϵ-dependent Group Actions on M	212
4.8.1.1: Lift to G Action on the Path Space	213
4.8.1.2: Lift to G Action on the Jet Space	213
4.8.1.3: Maps from the Lie Algebra to Vector Fields on M, PM, and JM .	214
4.8.1.4: The Momentum Map	214
4.8.1.5: Momentum Map on PM	215

4.8.1.6: Momentum Map on JM	215
4.8.1.7: Equivariance of JM's Momentum Map	215
4.8.2: The Path Group: PG	216
4.8.2.1: The Path Lie Algebra: Pg	217
4.8.2.2: The Dual of the Lie Algebra of the Path Group	217
4.8.2.3: The Action of the Path Group on the Path Space	217
4.8.3: The Jet Group: JG	218
4.8.3.1: The Lie Algebra of the Jet Group: Jg	219
4.8.3.2: Homomorphism from Jg to Vector Fields on JM	220
4.8.3.3: The Dual of the Jet Lie Algebra: Jg^*	221
4.8.3.4: The Jet Momentum Maps	221
4.8.4: When M is a Coadjoint Orbit with the KKS Symplectic Structure	222
4.8.4.1: Coadjoint Action of PG	223
4.8.4.2: The KKS Symplectic Structure on Coadjoint Orbits in Pg^*	223
4.8.5: Natural Projections and Injections of G, PG, and JG	224
4.8.5.1: Projections and Injections of the Lie Algebras and Duals	225
4.8.6: The Lie Poisson Bracket on g^*	226
4.8.6.1: The Lie Poisson Bracket on Jg^*	226
4.8.6.2: Jg^* as J-jets of Paths in g^*	226
4.8.6.3: Coadjoint Orbits in Jg^*	227
4.8.6.4: JM is a Coadjoint Orbit in Jg^* as a Manifold	228
4.8.6.5: The KKS Symplectic Structure is the Jet Symplectic Structure	228
4.8.7: JG as a Semi-Direct Product	230

4.8.8: Jet and Path Reduced Spaces are Reduced Jet and Path Spaces	231
Chapter 5. Kruskal's Theory of Nearly Periodic Systems	232
 5.1: Introduction: Kruskal's Approach	232
 5.2: The New Approach Expressed in Coordinates	236
 5.3: The Geometric Version of the New Approach	241
 5.4: Extensions and Limitations of Kruskal's Theory	243
5.4.1: Secular Perturbation Theory	244
5.4.1.1: Lie Transforms	246
5.4.1.2: Two-Timing	246
5.4.2: $1/\epsilon$ Time of Validity for Kruskal's Technique	247
5.4.3: Averaging with Multiple Frequencies	249
5.4.4: Averaging Over Ergodic Orbits	250
5.4.5: Non-uniqueness of Symmetry for Finite Perturbation	250
Chapter 6. Ponderomotive Force and Gyromotion	252
 6.1: Ponderomotive-like Forces	252
6.1.1: Intuitive Treatment	254
6.1.2: Introducing the Asymptotic Scaling	257
6.1.3: Using the Kruskal-like Perturbation Method	261
6.1.3.1: The Coordinates x, v_x, A, θ	261
6.1.3.2: Result of the Method of Averaging	263
6.1.3.3: Calculation of the Roto-rate Vector Field	264
6.1.3.4: The Hamiltonian Structure	267
6.1.4: Obtaining the Action to First Order	269

6.2: Some Comments on Perturbation Calculations	271
6.3: 2D Gyromotion via the New Kruskal-like Method	275
6.3.1: The Four Components of R_1	279
6.3.2: The Four Components of R_2	282
6.3.3: Summary of the Calculation	288
6.4: The Hamiltonian Structure of Gyromotion	290
6.4.1: The Poisson Bracket	290
6.4.2: The Symplectic Structure	291
6.4.3: Uniqueness of the Generator for a Vector Field	293
6.4.4: Comparison With Robert Littlejohn's Results	294
6.4.5: Prospects for a Fully Hamiltonian Theory	298
PART II: WAVES	301
Chapter 7. Asymptotic Wave Theory	303
7.1: Wave Asymptotics and Approximate Symmetry	303
7.1.1: Eikonal Waves	305
7.1.1.1: Sources with Time Scales Generate Eikonal Waves	308
7.1.1.2: Dispersive Media Create Eikonal Waves	310
7.1.1.3: Whitham's Generalization to Nonlinearity	310
7.1.1.4: Sinusoidal Waves	311
7.1.2: The Local Fourier Transform	312
7.1.3: Stationary Phase, Laplace's Method, and Steepest Descents	314
7.1.3.1: Heisenberg's Uncertainty Principle	317
7.1.3.2: Asymptotic Waves with a Definite k and y	320

7.1.4: Eikonal Waves and Lagrangian Submanifolds	324
7.2: WKB Theory and Asymptotic Equations	327
7.2.1: The Structure of First Order P.D.E.'s	330
7.2.2: Hamilton-Jacobi Theory and Symplectic Manifolds	333
7.2.3: Cotangent Bundles, Contact Spaces, and Jet Spaces	336
7.2.4: The Contact Bundle and the Conormal Bundle	337
7.3: Limitations of WKB Theory	338
Chapter 8. A Hamiltonian Approach to Wave Modulation	341
8.1: Introduction	341
8.2: Periodic Solutions	343
8.2.1: The Hamiltonian Restricted to Periodic Solutions	343
8.2.2: The Symplectic Structure Restricted to Periodic Solutions	344
8.2.2.1: A Degenerate Poisson Structure on the Periodic Solutions	345
8.2.3: The Action of Periodic Orbits	346
8.3: Modulations	347
8.3.1: Stationary Phase Integrals	347
8.3.2: The Modulational Poisson Brackets	348
8.3.3: The Modulational Hamiltonian	349
8.4: Global Symmetry Implies Local Conservation Law	350
8.5: The Nonlinear Klein-Gordon Equation	353
Chapter 9. A Lie Poisson Bracket for Wave Action Density	359
9.1: Explicit Calculation of the Lie Poisson Bracket	359
9.2: The Geometrical Picture	364

<i>Table of Contents</i>	xxi
PART III: DISSIPATION AND STATISTICS	367
Chapter 10. Imbedding and Projection Theorems	369
10.1: Imbedding in a Hamiltonian System	369
10.2: Projection from a Hamiltonian System	372
10.3: Dangerous Operations with Unbounded Variables	374
10.3.1: Eg.: Surreptitiously Changing Damping to Driving	374
10.3.2: Eg.: Pitfalls in the Use of Lie Transforms	375
10.4: Imbedding in Poisson Systems	379
Chapter 11. Projected Area and Canonical Transformations	382
11.1: Application to Particle Accelerators	383
11.1.1: Courant's Theorem	384
11.2: Relation to the Uncertainty Principle	386
11.3: Weinstein's Approach	388
11.4: Theorem for Linear Canonical Transformations	393
11.4.1: The Geometry of Projected Parallelepipeds	395
11.4.2: The Case of Linear Canonical Transformations	402
Chapter 12. Reversibility vs. Irreversibility	408
Chapter 13. Hamiltonian Dissipation in Infinite Dimensions	411
13.1: Poincaré Recurrence and Attractors	412
13.1.1: The Lack of Recurrence in Infinite Dimensions	413
13.2: Asymptotic and Liapunov Stability	414
13.2.1: Almost Attractors	414
13.3: Reversible Attractors and Infinite Dimensional Hamiltonians	415

13.3.1: Reversible Almost Attractor in the Wave Equation	415
13.3.2: The Liouville Equation and Koopmanism	416
13.3.3: Landau Damping	417
13.3.4: The Boltzmann Equation and the BBGKY Hierarchy	417
13.3.5: Dissipation from Resonance	418
13.3.6: Resonant Coupling of Eikonal Waves	425
13.4: The String with a Spring	426
Chapter 14. Reinsertion in Area-Preserving Horseshoes	428
14.1: The $2x \bmod 1$ Map	429
14.2: The Baker's Transformation	431
14.3: The Horseshoe	432
14.4: Example of Horseshoes in Gyromotion	434
14.5: Area Preserving Horseshoes and Reinsertion	439
Chapter 15. Renormalization Group	443
15.1: Scaling and Universality	443
15.2: Magnetic Spin Lattices	446
15.3: The Central Limit Theorem	450
15.4: A Poor Man's Feigenbaum Number	454
Chapter 16. Symplectic Thermodynamics from Maximum Entropy	460
16.1: Previous Approaches to Geometric Thermodynamics	461
16.2: Seven Approaches to the Maximum Entropy Formalism	466
16.2.1: Axiomatic Subjective Approach	467
16.2.2: Counting Sequences of Trials	468

16.2.3: Via Steepest Descents in Two Ways	470
16.2.4: Via Probability in Three Ways	474
16.3: The Thermodynamic Limit	476
16.3.1: The Density of States	477
16.3.2: The Partition Function	478
16.4: Maximum Entropy Applied to Statistical Mechanics	479
16.5: Some Symplectic and Contact Geometry	483
16.5.1: Hypersurfaces Determined by a Function	484
16.5.1.1: The Underlying Manifold M	486
16.5.1.2: The Graph of a Function	486
16.5.1.3: The Cotangent Bundle	486
16.5.1.4: The First Jet Bundle	487
16.5.1.5: The Space of Contact Elements	487
16.5.2: The Conormal Bundle	488
16.5.3: The Wavefront Set	489
16.5.4: The Space of Tangent Contact Elements	490
16.5.5: Legendre Transforms and Linear State Spaces	491
16.5.5.1: The Legendre Map	491
16.5.5.2: The Legendre Transform	492
16.5.5.3: The Legendre Transform and a Function's Graph	493
16.5.5.4: Legendre Transforms and Projective Duality	494
16.5.5.5: Legendre Transforms and Uncertainty Relations	498
16.5.5.6: Legendre Transforms and Jets of Functions	499

16.6: The Origin of the Lagrangian Submanifolds in Physics	500
16.6.1: Constrained Integration and Extremization	500
16.6.2: Paths Constrained on Surfaces	501
16.6.3: The Wavevector as a Kind of Force	502
16.6.4: Distributions Constrained on Subsystems	503
16.6.5: Thermodynamic Forces	504
16.6.6: Lagrange Multipliers and Legendre Maps	505
16.6.6.1: Constant Force Asymptotic Systems	506
16.6.7: Lagrangian Submanifolds and Constrained Extremization . . .	507
16.6.7.1: Parametrizing Lagrangian Submanifolds	507
16.6.7.2: Theorem on Pushing Forward Lagrangian Submanifolds . .	508
16.6.7.3: Application of the Theorem to Waves	509
16.6.7.4: Application of the Theorem to Thermodynamics	509
16.7: Theorem on the Pushforward of Legendre Submanifolds	511
16.7.1: The Contact Structure for Thermodynamics	512
16.7.1.1: The Contact Form for Jets of Entropy	513
16.7.1.2: The $U, V, (1/T), (p/T)$ Symplectic Manifold	513
16.7.1.3: The (S, V, p, T) Symplectic Manifold	514
16.7.2: Legendre Transforms and Thermodynamic Potentials	514
16.8: Phase Transitions and the Geometry of the Equation of State . . .	516
16.8.1: Caustics and Phase Transitions	517
16.8.2: Convexity and First Order Phase Transitions	517
16.8.3: A Generalization of Maxwell's Equal Area Rule	521

16.9: Relations Between Symplectic Thermodynamics and Mechanics	525
16.9.1: A) Eikonal Waves and Stationary Phase	525
16.9.1: B) Thermodynamic Limit and Steepest Descents	525
16.9.2: A) Waves and the Feynman Path Integral	526
16.9.2: B) Probability and the Maximum Entropy Formalism	526
16.9.3: A) Wave Path Integrals over a Subspace	527
16.9.3: B) Probability Distribution Averages over a Subspace	527
16.9.4: A) Lagrange Multipliers and Canonical Conjugacy	528
16.9.4: B) Lagrange Multipliers and Thermodynamic Conjugacy	529
16.9.5: A) Fourier Transforms and Legendre Transforms	529
16.9.5: B) Laplace Transforms and Legendre Transforms	530
Chapter 17. Glossary of Terms	532
Chapter 18. Bibliography	540
