Contents

Chapter I Introduction

1 The Nature of Computational Physics 1
2 The Computer in Physical Theory 2
3 The Limitations of Mathematical Analysis 4
4 The Discrete Nature of the Computer 5
5 Summary of the Content 7

Chapter II Elements of the Difference Method

1 Introduction: Finite Elements in Physics 10
2 Discrete Representation of a Continuous Variable . . . 11
3 Difference Derivatives in Space 15
4 General Formulation of the Initial-Value Problem . . . 18
5 Requirements of a Difference Solution to the Initial-Value Problem 22
(*a*) *Consistency of a difference approximation* . . . 22
(*b*) *Accuracy of a difference approximation* . . . 23
(*c*) *Stability of a difference scheme* 23
(*d*) *Efficiency of a difference scheme* 26
6 Integration of Ordinary Differential Equations . . . 26
(*a*) *The Euler first-order method* 27
(*b*) *The leapfrog method* 32
(*c*) *The explicit two-step method* 34
(*d*) *Implicit second-order method* 36
7 High-Order Ordinary Differential Equations 38

Chapter III Partial Difference Equations for Continuous Media

1 The Occurrence and Some Properties of Partial Differential Equations in Physics 40
(*a*) *Principles of conservation applied to continuous media* . 40
(*b*) *Physical processes and the dispersion relation* . . . 46
(*c*) *Waves and the wave equation* 46

(*d*) *The advective equation* 47
(*e*) *The diffusion equation* 48
(*f*) *The elliptic equation* 49
(*g*) *Classification of partial differential equations* . . . 50
2 The Stability of Difference Schemes for Partial Differential Equations. 50
3 The Diffusion Equation: First-Order Explicit Integration . 53
4 The Advective Equation: First-Order Explicit Integration . 55
5 Dispersion and Diffusion on a Difference Mesh . . . 57
6 Conservation on a Difference Mesh 61
7 Conservative Methods for Hyperbolic Equations . . . 63
(*a*) *The conservative Lax method* 63
(*b*) *The conservative leapfrog method* 65
(*c*) *The two-step Lax–Wendroff scheme* 67
(*d*) *Quasi-second-order method* 69
8 Multidimensional Explicit Methods 72
9 Summary of Methods for Parabolic Equations . . . 76
(*a*) *Explicit first-order method* 76
(*b*) *The Crank–Nicholson implicit method* 77
(*c*) *The unstable leapfrog method* 77
(*d*) *The Dufort–Frankel method* 78

Chapter IV Numerical Matrix Algebra

1 Introduction 80
2 Matrix Equations from the Finite Difference Calculus . . 82
(*a*) *Boundary-value problems* 83
(*b*) *The implicit formulation of initial-value problems* . . 86
3 Special Matrices: Recurrence Solution of the Tridiagonal Matrix Equation 88
(*a*) *Algebraic approach* 88
(*b*) *Matrix approach* 90
4 Special Matrices: The 'Exact' Solution of Poisson's Equation . 91
(*a*) *Multiple Fourier analysis* 92
(*b*) *Fourier analysis and cyclic reduction* 96
(*c*) *Double cyclic reduction* 98
(*d*) *Summary* 98
5 The Exact Solution of the General Matrix Equation . . 99
6 'Inexact' or Iterative Methods for the Solution of the Matrix Equation 101
(*a*) *The properties and formulation of an iterative matrix* . 103
(*b*) *The Jacobi method* 106
(*c*) *Gauss–Seidel iteration* 107

(*d*) *Successive over-relaxation* 108
(*e*) *Cyclic Chebyshev method* 109
(*f*) *Alternating-direction implicit method* 111
7 Two Inexact Methods for the Determination of Eigenvectors and Eigenvalues 114
(*a*) *The maximum eigenvalue* 114
(*b*) *Determination of all eigenvalues and eigenvectors* . . 115

Chapter V Particles: *N*-body Action at a Distance

1 Particles and Assemblies of Particles 116
2 Single-Particle Motion in Conservative Fields . . . 117
3 Single-Particle Motion in a Perpendicular Magnetic Field . 119
4 *N*-body Direct 'Action-at-a-Distance' Simulation . . . 122
5 Equilibrium Statistical Properties from Particle-Particle Models 124
(*a*) *Thermodynamic properties of classical fluids by time averaging* 126
(*b*) *Ensemble averaging: the Monte Carlo method* . . 128

Chapter VI Particle-Field Calculations

1 The Average Field from Particle Assemblies 132
(*a*) *Continuous fields from long-range forces* . . . 132
(*b*) *Collisions and the continuum: the Debye sphere* . . 136
(*c*) *The plasma and gravitational frequencies* . . . 138
(*d*) *Summary of the collisionless model* 139
2 The Collisionless Particle-in-Cell Model 140
(*a*) *Formulation of the PIC model* 140
(*b*) *Dimensionless form of the equations and the time step* . 142
(*c*) *Remarks on the limitations of the PIC model* . . . 145
3 The Collisionless Particle-in-Cell Model Applied to Plasma Simulation 146
4 The Collisionless Particle-in-Cell Model Applied to the Simulation of Galaxies 149
5 The Collision-Dominated PIC Model in Hydrodynamics . 155
(*a*) *Lagrangian motion and the hydrodynamic equations* . . 155
(*b*) *The PIC method for an ideal gas* 157

Chapter VII Particles in Self-Consistent Fields: Atoms and Solids

1 Self-consistent Fields in the Quantum Theory of Particle Assemblies 162
(*a*) *Preliminary discussion* 162
(*b*) *Variational principle and the Hartree equations* . . 163

2 Indistinguishability of the Particles and the Exchange Potential 167
3 The Atom as a Few-electron Assembly 171
(a) *The central-field approximation* 174
(b) *Successive solution for the potentials and radial wave functions* 176
4 Solids as an Example of Many-electron Systems . . . 179
5 Expansion of The Hartree–Fock Equations for Bloch Waves . 182
(a) *Plane waves* 182
(b) *Orthogonalized plane waves* 184

Chapter VIII Phase Fluids

1 The Density of Particles in Phase Space and the Vlasov Equation 186
2 Remarks and Some Examples of The Vlasov Equation . . 188
(a) *Collisionless gravitational system* 190
(b) *Collisionless one-species plasma* 190
3 The Difference Solution of the Vlasov Equation . . . 191
4 Incompressibility of the Phase Fluid 193
5 The Waterbag Method 195

Chapter IX Classical Fluid Dynamics

1 Introductory Remarks on the Hydrodynamic Equations . 201
(a) *Conservative, Eulerian and Lagrangian formulations* . 202
(b) *Diffusion processes* 203
(c) *Compressible and incompressible formulations* . . 205
2 Difference Solution of the Incompressible Equations . . 206
(a) *Vorticity and the stream function* 206
(b) *The pressure method* 211
3 Incompressible Flow as an Assembly of Vortex Particles . 216
(a) *Conservation laws for an incompressible fluid* . . . 216
(b) *Particle-in-cell simulation of incompressible fluids* . . 218
(c) *Some fundamental incompressible flow solutions* . . 220
4 The Marker-and-Cell Method for Surfaces and Heavy Fluids: Splashes, Waterfalls and Breaking Waves 223
5 The Difference Solution of the Compressible Hydrodynamic Equations 232
(a) *Lagrangian methods for the one-dimensional problem* . 234
(b) *Eulerian explicit methods for the general multidimensional problem* 236
6 The Treatment of Shocks and Discontinuities . . . 243

7 Hydrostatic Equilibrium in the Simulation of the Atmosphere and the World Ocean 248
(*a*) *Shallow fluid equations on the earth's surface* . . . 248
(*b*) *Solution of the dynamic equations in the atmosphere* . 251
(*c*) *Simulation of the world ocean* 254

Chapter X Hydrodynamics with Long-Range Forces: Stars, Plasmas, Magneto-fluids

1 Self-consistent Fields in Fluid Assemblies 257
2 The Magnetohydrodynamic Equations and Their Simple Properties. 261
(*a*) *Eulerian equations and conservative properties* . . 261
(*b*) *Advection and the Lagrangian formulation* . . . 263
(*c*) *Electron and ion energies in a plasma* 264
3 One-Dimensional Methods in Magnetohydrodynamics . . 266
(*a*) *Explicit methods: Eulerian and Lagrangian meshes* . . 267
(*b*) *Nonlinear diffusion terms* 270
(*c*) *The Hain implicit method* 272
(*d*) *The 'vacuum' region* 274
4 Multidimensional Magnetohydrodynamics 275
(*a*) *Explicit conservative methods* 276
(*b*) *The magnetic vector potential* 279
(*c*) *Concluding remarks on special techniques in magnetohydrodynamics* 283
5 Gravitational Hydrodynamics 284
(*a*) *The dynamic equations with radiation* 284
(*b*) *The Lagrangian mass coordinate* 286
(*c*) *An explicit difference solution for stellar pulsation* . . 288
