<i>Participants</i>	<i>ix</i>
<i>Lecturers</i>	<i>xiii</i>
<i>Preface (in French and in English)</i>	<i>xv</i>
<i>Course 1. Introduction to the mathematical theory of dynamical systems, by O.E. Lanford III</i>	<i>3</i>
0. Introduction	6
1. Invariant manifolds	6
1.1. Preliminaries	8
1.2. Sketch of proof of local stable manifold theorem	9
2. Horseshoe and solenoid examples	15
3. Hyperbolic sets and Axiom A	25
4. Ergodic theory	37
5. The Bowen–Ruelle ergodic theorem	47
References	51
<i>Course 2. Numerical exploration of Hamiltonian systems, by M. Hénon</i>	<i>53</i>
1. Generalities	57
1.1. Dynamical systems	58
1.2. Phase space	58
1.3. Integrals	59

1.4. Various cases	60
1.5. Approaches	62
2. Surfaces of section, mappings	63
2.1. Definition and properties	63
2.2. Fixed points	66
2.3. Cycles	68
2.4. Invariant manifolds	69
3. Hamiltonian systems	71
3.1. Definitions and properties	71
3.2. Periodic orbits and their stability	72
4. Integrable and ergodic systems	74
4.1. Integrable systems	74
4.2. Example	76
4.3. Tori and trajectories	78
4.4. Surface of section	79
4.5. Over-integrable systems	81
4.6. Relevance of integrable systems	82
4.7. Ergodic systems	82
5. One degree of freedom	83
6. Two degrees of freedom	84
6.1. First example: triangular potential	84
6.2. Second example: restricted problem	91
6.3. Third example: quadratic mapping	95
6.4. Islands	101
6.5. KAM theorem	107
6.6. Chaotic regions	110
6.7. Separation of orbits	117
6.8. Last example: the oval billiard	129
7. Three degrees of freedom	136
7.1. Techniques	136
7.2. Weakly coupled mappings	143
7.3. Arnold diffusion	148
8. Many degrees of freedom	151
8.1. Parallel sheets	151
8.2. Fermi–Pasta–Ulam experiment	154
9. Mappings on a lattice	161
References	168

<i>Course 3. Semi-classical mechanics of regular and irregular motion, by M.V. Berry</i>	<b>171</b>
1. Introduction	174
2. Regular and irregular classical motion	175
2.1. Two contrasting types of orbit	175
2.2. Integrable systems	176
2.3. Chaotic systems	181
2.4. Quasi-integrable systems	185
2.5. Pseudo-integrable systems	187
2.6. Discrete area-preserving maps of the plane	190
3. Wave functions and Wigner functions	195
3.1. Maslov's association between phase-space surfaces and semi-classical wave functions	195
3.2. Globalization	198
3.3. Wigner's function and the semiclassical eigenfunction hypothesis	201
3.4. Regular and irregular quantum states	205
3.5. Crossing of nodal lines when $N=2$	211
4. Eigenvalues: spectra on the finest scales	213
4.1. Quantum conditions	213
4.2. Degeneracies	217
4.3. Level spacings	226
5. Eigenvalues: spectra on larger scales	232
5.1. Mean level density	232
5.2. Oscillatory corrections and closed orbits	239
5.3. Comments on the closed-orbit sum	245
6. Quantum maps	252
6.1. Evolving states	252
6.2. Stationary states	262
References	267

<i>Course 4. Bifurcations de difféomorphismes de <math>\mathbb{R}^2</math> au voisinage d'un point fixe elliptique, par A. Chenciner</i>	<b>273</b>
0. Introduction: Equations différentielles et difféomorphismes; exemples autour de Van der Pol et de Liénard	277
0.1. Equations de Van der Pol et de Liénard	277
0.2. Bifurcations de familles à 1 paramètre	280
0.3. Bifurcations de familles à 2 paramètres	286
0.4. Equations non autonomes et difféomorphismes	289

<b>1. Du théorème des contractions au théorème des fonctions implicites: persistance des points fixes</b>	<b>292</b>
1.1. Contractions	293
1.2. Contractions déguisées: hyperbolicité	294
1.3. Fonctions implicites	296
1.4. Courbes invariantes	298
<b>2. Formes normales de difféomorphismes de <math>\mathbb{R}^2</math> au voisinage d'un point fixe</b>	<b>302</b>
2.1. Calculs formels	302
2.2. Familles à paramètres	304
2.3. Etude géométrique des familles génériques de formes normales tronquées (cas "non fortement résonnant")	305
2.4. Résonances fortes	309
<b>3. Bifurcations de courbes invariantes normalement hyperboliques</b>	<b>313</b>
3.1. Domaines d'hyperbolicité normale $\mathcal{H}$	313
3.2. Théorèmes de bifurcation lorsque $\mu \in \mathcal{H}$	315
3.3. Dynamique sur les courbes invariantes	319
<b>4. Bifurcations de courbes invariantes non normalement hyperboliques</b>	<b>325</b>
4.1. Introduction	325
4.2. Résultats	327
4.3. Idée des démonstrations	329
<b>5. Bifurcations de points homoclines</b>	<b>336</b>
<b>6. Conclusion</b>	<b>343</b>
<b>Bibliographie</b>	<b>347</b>
 <i>Course 5. Stability and bifurcation theory, by D.D. Joseph</i>	 349
<b>1. Bifurcation in <math>\mathbb{R}'</math></b>	<b>352</b>
<b>2. Bifurcation in <math>\mathbb{R}^2</math></b>	<b>358</b>
<b>3. Projections into <math>\mathbb{R}^2</math></b>	<b>364</b>
<b>4. Bifurcation of periodic orbit. Normal forms</b>	<b>367</b>
4.1. Derivation of the autonomous equation	369
<b>5. Bifurcation from periodic solutions. Hopf bifurcation into a torus of subharmonic and asymptotically quasiperiodic solutions</b>	<b>373</b>
5.1. Subharmonic bifurcation	376
5.2. Rotation number and lock-ins	377
5.3. Experiments	378
<b>References</b>	<b>379</b>

<i>Course 6. The creation of non-trivial recurrence in the dynamics of diffeomorphisms, by S.E. Newhouse</i>	381
0. Introduction	384
1. Periodic orbits, their stable and unstable manifolds, under diffeomorphisms	385
References	395
2. Homoclinic motions. Morse–Smale diffeomorphisms	395
References	408
3. Infinitely many attracting periodic orbits in two dimensional dynamics	408
References	415
4. Curves of diffeomorphisms starting at Morse–Smale systems	416
References	426
5. Elements of proofs of Theorem (4.3)(3)	426
6. Open problems on curves of diffeomorphisms starting at structurally stable elements	434
References	442
<i>Seminar. Generic properties of conservative systems, by S.E. Newhouse</i>	443
<i>Course 7. Route to chaos with special emphasis on period doubling, by J.P. Eckmann. Notes written by R.S. MacKay</i>	453
1. Routes to chaos	457
1.1. Aim	457
1.2. Simple systems can have complicated solutions	458
1.3. Dynamical systems are hard to classify	462
1.4. Scenarios in 1-parameter families	465
1.5. Ruelle–Takens scenario	465
1.6. Transition to turbulence by intermittency	469
1.7. Period doubling scenario	470
2. Maps on an interval	471
2.1. Generalities	471
2.2. Periodic orbits and their stability	472
2.3. Assumptions	473

2.4. Kneading theory	475
2.5. 1-parameter families	479
2.6. Exchange of intervals	480
2.7. The kneading sequence $(R^*)^\infty$	483
3. General theory of doubling	484
3.1. Introduction	484
3.2. Hypotheses	484
3.3. Consequences	486
3.4. Comments	490
3.5. Typical difficulties in proving the hypotheses	491
3.6. Further consequences	492
4. The known examples where the doubling theory applies	498
4.1. Introduction	498
4.2. Maps of the interval $x \rightarrow h( x ^{1+\varepsilon})$ , $\varepsilon > 0$ , small	498
4.3. Analytic maps on an interval	500
4.4. Maps of $\mathbb{R}^n$	504
4.5. Area preserving maps	507
References	509

*Course 8. Nonlinear problems in ecology and resource management, by R.M. May*

1. Introduction	516
2. One-dimensional difference equations, with one critical point	517
2.1. Motivation	517
2.2. Properties	519
2.3. Biological examples	523
3. One-dimensinal difference equations, with two critical points	528
3.1. Motivation	528
3.2. Properties	530
3.3. Frequency-dependent natural selection	536
4. More-than-one-dimensional difference equations	543
4.1. Single populations with discrete but overlapping age classes	543
4.2. Two interacting populations	545
4.3. Local versus global stability	546
5. Differential-delay equations	547
5.1. Motivation	547
5.2. Properties of such equations	549
5.3. Biological examples	555

6. Coupled differential equations	557
6.1. General remarks	557
6.2. Three competing species	558
6.3. Predator-prey, host-parasite and other nonlinear biological systems	558

7. Conclusions	559
----------------	-----

References	560
------------	-----

<i>Course 9. Maps of an interval, by M. Misiurewicz</i>	565
---	-----

0. Introduction	568
-----------------	-----

1. Topological theory of chaos	568
--------------------------------	-----

2. Smooth maps	571
----------------	-----

3. Bifurcations	574
-----------------	-----

4. Typical behaviour of orbits	578
--------------------------------	-----

5. Piecewise expanding maps	588
-----------------------------	-----

References	589
------------	-----

<i>Course 10. Laboratory experiments on the transition to chaos, by J.P. Gollub and A. Libchaber</i>	591
--	-----

1. Introduction	594
-----------------	-----

2. Small aspect ratio convection	595
----------------------------------	-----

2.1. Quasiperiodicity and phase locking	595
---	-----

2.2. Subharmonic bifurcations	597
-------------------------------	-----

2.3. Intermittency	597
--------------------	-----

2.4. Modulation experiments	598
-----------------------------	-----

3. Large aspect ratio	599
-----------------------	-----

3.1. Heat flux experiments	599
----------------------------	-----

3.2. Laser Doppler experiments	601
--------------------------------	-----

3.3. High Prandtl number experiments	603
--------------------------------------	-----

4. Coupled nonlinear oscillations	603
-----------------------------------	-----

5. Summary	605
------------	-----

References	606
------------	-----

<i>Course 11. Models for intermittency, by Y. Pomeau</i>	609
--	-----

<i>Course 12. Hydrodynamic stability of shear flows, by S.A. Orszag and A.T. Patera</i>	621
---	-----

1. Introduction	624
2. Overview	626
3. Linear theory of parallel channel flows	627
4. Finite amplitude nonlinear analysis	634
4.1. Introduction	634
4.2. Analytic approach—amplitude equations	637
4.3. Iterative technique	640
4.4. Time dependent behaviour	643
4.5. Plane Couette flow and pipe flow	646
5. Three dimensional instability	648
5.1. Introduction	648
5.2. Linear theory	648
5.3. Vorticity dynamics	653
5.4. Plane Couette flow and pipe flow	658
References	661

<i>Course 13. Fully developed turbulence and singularities, by U. Frisch</i>	665
--	-----

1. Introduction	668
1.1. Conservation laws and invariance properties	669
1.2. Some experimental results	671
2. Regularity/singularity of Euler and Navier–Stokes flows	673
2.1. High frequency asymptotics and singularities	674
2.2. Regularity results for Euler flows	677
2.3. Numerical exploration of singularities for Euler flows. The Taylor–Green vortex	681
2.4. Navier–Stokes flows	690
3. Statistical theory	691
3.1. What is “fully developed turbulence”?	691
3.2. The statistical description	692
3.3. The Kolmogorov 1941 self-similar picture	693

3.4. Breakdown of self similarity intermittency and non-compact symmetry groups	696
3.5. Whither turbulence?	699
References	701

<i>List of seminars delivered during the session</i>	707
