<i>Preface</i>	v
CHAPTER 1 PRELIMINARY SURVEY	1
1 Formulation of the simplest problem	1
2 Provisional derivation of the Euler-Lagrange equations	4
3 Extensions and generalizations	9
CHAPTER 2 THE SIMPLEST PROBLEM IN THE CALCULUS OF VARIATIONS: THE NON-HOMOGENEOUS CASE (Geometrical Optics and Non-relativistic Mechanics)	12
1 The canonical momenta and the Hamiltonian function	13
2 The Hamilton-Jacobi equation	18
3 The canonical and the Euler-Lagrange equations	25
4 The independent integral of Hilbert: Mayer fields	31
5 Extreme values of the fundamental integral: the conditions of Weierstrass	34
6 Fundamental properties of extremal arcs	39
7 The parameter as additional x -coordinate	44
8 The general theory of first order partial differential equations	48
(a) The characteristics of the partial differential equation	49
(b) Explicit construction of a solution of the partial differential equation	51
(c) The complete figure	56
(d) Uniqueness of solutions	58
(e) The case when Φ contains S explicitly	60
9 The variational problem associated with a given partial differential equation of the first order	63
10 The fundamental variational formula: the theorem of Noether for single integrals	68
11 The characteristic function: the principles of Fermat and Huygens in geometrical optics	74

12	Canonical transformations	82
13	Classical mechanics and non-relativistic quantum mechanics	99
	(a) Classical mechanics	101
	(b) Transition to the Schrödinger scheme	104
	(c) Transition to the Heisenberg scheme	109
	(d) Equivalence of the two schemes	116
14	Integral invariants: classical and statistical mechanics	120
15	The accessory problem: the condition of Jacobi	127
CHAPTER 3 THE SIMPLEST PROBLEM IN THE CALCULUS OF VARIATIONS: THE HOMOGENEOUS CASE (Metric Differential Geometry and Relativistic Mechanics)		141
1	The homogeneous Lagrangian and the canonical formalism	142
2	The geometrical background	152
3	The Weierstrass excess function	160
4	The Hamilton-Jacobi equation	166
5	Properties of extremals	175
6	Relativistic particle mechanics	180
7	Relativistic quantum mechanics	188
8	Lagrangians depending on higher order derivatives	199
CHAPTER 4 MULTIPLE INTEGRAL PROBLEMS (Field Theories)		208
1	The general variational formula	210
2	The theory of Weyl; the imbedding theorem	218
3	The theory of Carathéodory	234
4	The general theory	250
5	Parameter-invariant multiple integral problems	265
	(a) Invariance properties of multiple integrals	266
	(b) Characterization of parameter-invariant integrals defined by Lagrangians which do not depend explicitly on the parameters	268
	(c) Parameter-invariant integrals associated with arbitrary integrals	272
	(d) Minimal surfaces	275
	(e) The general theory applied to parameter-invariant integrals	280
	(f) The geometrical background	283
6	The theorem of Noether	293

7	The theory of physical fields	298
	(a) General field theory	298
	(b) Scalar field	304
	(c) Vector field (including the electromagnetic field)	304
8	Multiple integral problems with quadratic integrands: linear partial differential equations of the second order	311
	(a) Tensorial form of the Euler-Lagrange equations	311
	(b) Elliptic equations: the Dirichlet integral	314
	(c) Hyperbolic equations: the bi-characteristics	316
 CHAPTER 5 THE PROBLEM OF LAGRANGE (Dynamical Systems Subject to Constraints)		 323
1	Formulation of the problem	324
2	The canonical formalism	332
3	The canonical equations; the class of a problem of Lagrange	337
4	The isoperimetric problems	347
5	Non-holonomic dynamical systems	352
6	The geometry of dynamics: the principle of extremal curvature	358
 APPENDIX		 366
1	Notation; tensor algebra and analysis	366
2	Riemannian geometry	373
3	The general divergence theorem	380
4	Extreme values of quadratic forms subject to linear subsidiary conditions	383
 SUPPLEMENTARY APPENDIX		 385
 <i>Bibliography</i>		 419
 <i>Supplementary Bibliography</i>		 430
 <i>Index</i>		 433
