## I. CLASSIFICATION OF PARTIAL DIFFERENTIAL EQUATIONS

|                                                                                                 |    |
|-------------------------------------------------------------------------------------------------|----|
| 1. Classification of partial differential equations of the second order                         |    |
| 1. Differential equations with two independent variables . . . . .                              | 1  |
| 2. Classification of equations of the second order with several independent variables . . . . . | 9  |
| 3. Canonical forms of linear equations with constant coefficients . . .                         | 11 |
| Problems on Chapter I . . . . .                                                                 | 13 |

## II. EQUATIONS OF THE HYPERBOLIC TYPE

|                                                                       |    |
|-----------------------------------------------------------------------|----|
| 1. Simplest problems leading to equations of the hyperbolic type.     |    |
| Formulation of boundary problems                                      | 15 |
| 1. Equation of small transverse vibrations of a string . . . . .      | 15 |
| 2. Equation of longitudinal vibrations of rods and strings . . . . .  | 19 |
| 3. Vibrational energy of a string . . . . .                           | 21 |
| 4. Derivation of the transmission line equation                       | 23 |
| 5. Transverse vibrations of a membrane                                | 24 |
| 6. Equations of hydrodynamics and acoustics                           | 27 |
| 7. Boundary and initial conditions                                    | 32 |
| 8. Reduction of the general problem                                   | 37 |
| 9. Formulation of boundary problems for the case of several variables | 39 |
| 10. Uniqueness theorem                                                | 39 |
| Problems                                                              | 43 |
| 2. Method of propagating waves                                        | 45 |
| 1. D'Alembert's formula                                               | 45 |
| 2. Physical interpretation                                            | 47 |
| 3. Continuity of solutions                                            | 54 |
| 4. Semi-infinite region and the method of extending initial data      | 57 |
| 5. Problems for a finite segment                                      | 65 |
| 6. Dispersion of waves                                                | 68 |
| 7. Integral wave equation                                             | 73 |

|                                                                                               |     |
|-----------------------------------------------------------------------------------------------|-----|
| 8. Propagation of discontinuities along the characteristic curves . . .                       | 78  |
| Problems                                                                                      | 79  |
| 3. Method of separation of variables . . . . .                                                | 82  |
| 1. Equation of free vibrations of a string . . . . .                                          | 82  |
| 2. Interpretation of the solution . . . . .                                                   | 88  |
| 3. Representation of an arbitrary vibration as a superposition of<br>standing waves . . . . . | 92  |
| 4. Inhomogeneous equations . . . . .                                                          | 97  |
| 5. First general boundary problem . . . . .                                                   | 104 |
| 6. Boundary problems with stationary inhomogeneities . . . . .                                | 105 |
| 7. Steady state problems . . . . .                                                            | 108 |
| 8. Concentrated force . . . . .                                                               | 113 |
| 9. General scheme of the method of separation of variables . . . . .                          | 116 |
| Problems . . . . .                                                                            | 123 |
| 4. Problem with data on characteristics . . . . .                                             | 125 |
| 1. Formulation of the problem . . . . .                                                       | 125 |
| 2. Method of successive approximations . . . . .                                              | 127 |
| Problems . . . . .                                                                            | 133 |
| 5. Solution of general linear equations of the hyperbolic type . . . . .                      | 133 |
| 1. Conjugate differential operators . . . . .                                                 | 133 |
| 2. Integral form of solution . . . . .                                                        | 134 |
| 3. Physical interpretation of Riemann's function . . . . .                                    | 137 |
| 4. Equations with constant coefficients . . . . .                                             | 141 |
| Problems on Chapter II . . . . .                                                              | 145 |
| Appendices to Chapter II . . . . .                                                            | 147 |
| I. Vibrations of strings of musical instruments . . . . .                                     | 147 |
| II. Vibrations of rods . . . . .                                                              | 150 |
| III. Vibrations of a loaded string . . . . .                                                  | 155 |
| IV. Equations of gas dynamics and theory of shock waves . . . . .                             | 163 |
| V. Dynamics of the absorption of gases . . . . .                                              | 175 |
| VI. Physical analogies                                                                        | 186 |

### III. EQUATIONS OF THE PARABOLIC TYPE

|                                                                  |     |
|------------------------------------------------------------------|-----|
| 1. Physical problems leading to equations of the parabolic type. |     |
| Formulation of boundary-value problems . . . . .                 | 191 |
| 1. Linear problem of heat conduction . . . . .                   | 191 |
| 2. Equation of diffusion . . . . .                               | 196 |
| 3. Heat conduction in space . . . . .                            | 197 |
| 4. Formulation of boundary-value problems . . . . .              | 200 |
| 5. The maximum value principle . . . . .                         | 206 |
| 6. Uniqueness theorem . . . . .                                  | 209 |
| 7. Uniqueness theorem for an infinite region . . . . .           | 212 |

|                                                                                  |     |
|----------------------------------------------------------------------------------|-----|
| 2. Method of the separation of variables .....                                   | 213 |
| 1. Homogeneous boundary-value problem .....                                      | 213 |
| 2. Source function .....                                                         | 217 |
| 3. Boundary problems with discontinuous initial conditions .....                 | 220 |
| 4. Inhomogeneous equation of heat conduction .....                               | 228 |
| 5. First general boundary problem .....                                          | 231 |
| Problems .....                                                                   | 233 |
| 3. Problems in an infinite region .....                                          | 235 |
| 1. Source function for an infinite region .....                                  | 235 |
| 2. Heat propagation in an infinite region .....                                  | 243 |
| 3. Boundary-value problems for a semi-infinite straight line .....               | 253 |
| 4. Steady state problems .....                                                   | 262 |
| Problems on Chapter III .....                                                    | 266 |
| Appendices to Chapter III .....                                                  | 268 |
| I. Temperature waves .....                                                       | 268 |
| II. Effect of radioactive decay on the temperature of the<br>earth's crust ..... | 272 |
| III. Method of similarity in the theory of heat conduction .....                 | 278 |
| IV. Problem of freezing .....                                                    | 283 |
| V. Einstein-Kolmogorov' equation .....                                           | 288 |
| VI. $\delta$ -function .....                                                     | 292 |

#### IV. EQUATIONS OF ELLIPTIC TYPE

|                                                                                                             |     |
|-------------------------------------------------------------------------------------------------------------|-----|
| 1. Problems reducible to Laplace's equation .....                                                           | 301 |
| 1. Steady heat flow. Formulation of boundary-value problems ...                                             | 301 |
| 2. Potential flow in a fluid. Potential of a stationary current and<br>an electrostatic field .....         | 302 |
| 3. Laplace's equation in a curvilinear system of coordinates .....                                          | 304 |
| 4. Some particular solutions of Laplace's equation .....                                                    | 308 |
| 5. Harmonic functions and analytic functions of a complex<br>variable .....                                 | 310 |
| 6. The inversion transformation .....                                                                       | 312 |
| 2. General properties of harmonic functions .....                                                           | 314 |
| 1. Green's formula. Integral representation of a solution .....                                             | 314 |
| 2. Some fundamental properties of harmonic functions .....                                                  | 320 |
| 3. Uniqueness and stability of the first boundary-value problem                                             | 324 |
| 4. Problems with discontinuous boundary conditions .....                                                    | 325 |
| 5. Isolated singular points .....                                                                           | 327 |
| 6. Regularity of a harmonic function at infinity .....                                                      | 329 |
| 7. External boundary-value problem. Uniqueness of solution for<br>two- and three-dimensional problems ..... | 330 |
| 8. Second boundary-value problem. Condition of regularity at<br>infinity. Uniqueness theorem .....          | 334 |

|                                                                                                                |     |
|----------------------------------------------------------------------------------------------------------------|-----|
| 3. Solution of boundary-value problems for the simplest regions by the method of separation of variables ..... | 338 |
| 1. First boundary-value problem for a circle .....                                                             | 338 |
| 2. Poisson's integral .....                                                                                    | 343 |
| 3. Case of discontinuous boundary values .....                                                                 | 347 |
| 4. Source function .....                                                                                       | 349 |
| 1. Source function for the equation $\Delta u = 0$ and its fundamental properties .....                        | 349 |
| 2. Method of electrostatic images and the source function for a sphere .....                                   | 354 |
| 3. Source function for a circle .....                                                                          | 357 |
| 4. Source function for a half-space .....                                                                      | 359 |
| 5. Potential theory .....                                                                                      | 360 |
| 1. Volume potential .....                                                                                      | 360 |
| 2. Plane problem. Logarithmic potential .....                                                                  | 362 |
| 3. Improper integrals .....                                                                                    | 365 |
| 4. First derivatives of the volume potential .....                                                             | 372 |
| 5. Second derivatives of the volume potential .....                                                            | 376 |
| 6. Surface potentials .....                                                                                    | 380 |
| 7. Surfaces and Lyapunov's curves .....                                                                        | 384 |
| 8. Discontinuity of the potential of a double layer .....                                                      | 388 |
| 9. Properties of the potential of a single layer .....                                                         | 392 |
| 10. Application of surface potentials to the solution of boundary problems .....                               | 396 |
| 11. Integral equations .....                                                                                   | 401 |
| 6. Method of finite differences .....                                                                          | 406 |
| 1. Concept of the method of finite differences for Laplace's equation .....                                    | 406 |
| 2. Method of successive approximations for the solution of difference equations .....                          | 409 |
| 3. Modelling methods .....                                                                                     | 412 |
| Problems on Chapter IV .....                                                                                   | 413 |
| Appendices to Chapter IV .....                                                                                 | 416 |
| I. Asymptotic expression for the volume potential .....                                                        | 416 |
| II. Problems of electrostatics .....                                                                           | 419 |
| III. Fundamental problem of electrical prospecting .....                                                       | 426 |
| IV. Determination of vector fields .....                                                                       | 433 |
| V. Application of the method of conformal mapping to electrostatics .....                                      | 436 |
| VI. Application of the method of conformal mapping to hydrodynamics .....                                      | 440 |
| VII. Biharmonic equations .....                                                                                | 447 |

## V. WAVE PROPAGATION IN SPACE

|                                                                                         |     |
|-----------------------------------------------------------------------------------------|-----|
| 1. Problem with initial conditions. Method of averaging .....                           | 452 |
| 1. Method of averaging .....                                                            | 452 |
| 2. Method of descent .....                                                              | 455 |
| 3. Physical interpretation .....                                                        | 457 |
| 4. Method of images .....                                                               | 459 |
| 2. Integral relation .....                                                              | 461 |
| 1. Derivation of the integral relation .....                                            | 461 |
| 2. Consequences of the integral relation .....                                          | 465 |
| 3. Vibrations of finite volumes .....                                                   | 468 |
| 1. General scheme of the method of separation of variables.<br>Standing waves .....     | 468 |
| 2. Vibrations of a rectangular membrane .....                                           | 474 |
| 3. Vibrations of a circular membrane .....                                              | 478 |
| Problems on Chapter V .....                                                             | 485 |
| Appendices to Chapter V .....                                                           | 486 |
| I. Reduction of the equations of the theory of elasticity to the<br>wave equation ..... | 486 |
| II. Equations of the electromagnetic field .....                                        | 489 |

## VI. HEAT CONDUCTION IN SPACE

|                                                                                         |     |
|-----------------------------------------------------------------------------------------|-----|
| 1. Heat conduction in infinite space .....                                              | 503 |
| 1. Temperature propagation function .....                                               | 503 |
| 2. Conduction of heat in infinite space .....                                           | 508 |
| 2. Heat conduction in finite bodies .....                                               | 512 |
| 1. Outline of the method of separation of variables .....                               | 512 |
| 2. Cooling of a circular cylinder .....                                                 | 516 |
| 3. Determination of critical sizes .....                                                | 519 |
| 3. Boundary problems for regions with moving boundaries .....                           | 521 |
| 1. Green's theorem for the equation of heat conduction and the<br>source function ..... | 521 |
| 2. Solution of the boundary-value problem .....                                         | 525 |
| 3. Source function for the segment .....                                                | 528 |
| 4. Thermal potentials .....                                                             | 530 |
| 1. Properties of thermal potentials of a single and of a double layer .....             | 530 |
| 2. Solution of boundary-value problems .....                                            | 533 |
| Problems on Chapter VI .....                                                            | 535 |
| Appendices to Chapter VI .....                                                          | 537 |
| I. Diffusion of a cloud .....                                                           | 537 |
| II. Demagnetization of a cylinder by a coil .....                                       | 540 |
| III. Method of finite differences for the equation of heat con-<br>duction .....        | 545 |

## VII. EQUATIONS OF ELLIPTIC TYPE (CONTINUATION)

|                                                                                      |     |
|--------------------------------------------------------------------------------------|-----|
| 1. Fundamental problems leading to the equation $\Delta v + cv = 0$ . . .            | 556 |
| 1. Steady vibrations . . . . .                                                       | 556 |
| 2. Diffusion of gas in the presence of decay and with chain reactions                | 557 |
| 3. Diffusion in a moving medium . . . . .                                            | 558 |
| 4. Formulation of internal boundary problems for the equation<br>$\Delta v + cv = 0$ | 559 |
| 2. The source function . . . . .                                                     | 560 |
| 1. The source function                                                               | 560 |
| 2. Integral representation of the solution . . . . .                                 | 563 |
| 3. Potentials . . . . .                                                              | 567 |
| 3. Problems for an infinite region. The radiation principle . . . . .                | 570 |
| 1. The equation $\Delta v + cv = -f$ in infinite space . . . . .                     | 570 |
| 2. Principle of vanishing absorption . . . . .                                       | 571 |
| 3. Principle of limiting amplitude . . . . .                                         | 573 |
| 4. Radiation condition                                                               | 575 |
| 4. Problems of the mathematical theory of diffraction . . . . .                      | 580 |
| 1. Statement of the problem                                                          | 580 |
| 2. Uniqueness of the solution of the diffraction problem . . . . .                   | 581 |
| 3. Diffraction by a sphere                                                           | 584 |
| Problems on Chapter VII . . . . .                                                    | 592 |
| Appendices to Chapter VII                                                            | 595 |
| I. Waves in cylindrical guides                                                       | 595 |
| II. Electromagnetic vibrations in hollow resonators . . . . .                        | 606 |
| III. Skin effect . . . . .                                                           | 616 |
| IV. Propagation of radiowaves over the surface of the earth . . . .                  | 621 |

## SUPPLEMENT. SPECIAL FUNCTIONS

|                                                                      |     |
|----------------------------------------------------------------------|-----|
| Introduction                                                         | 627 |
| 1. Equations for special functions . . . . .                         | 627 |
| 2. Formulation of boundary problems in the case $k(a) = 0$ . . . . . | 628 |

## I. CYLINDRICAL FUNCTIONS

|                                                                                |     |
|--------------------------------------------------------------------------------|-----|
| 1. Cylindrical functions                                                       | 637 |
| 2. Boundary-value problems for Bessel's equation . . . . .                     | 648 |
| 3. Various types of cylindrical functions . . . . .                            | 652 |
| 4. Integral representations. Asymptotic formulae . . . . .                     | 661 |
| 5. Fourier-Bessel's integral and some integrals containing Bessel<br>functions | 670 |

|                                                                          |     |
|--------------------------------------------------------------------------|-----|
| 6. Representation of cylindrical functions by means of contour integrals | 675 |
|--------------------------------------------------------------------------|-----|

## II. SPHERICAL FUNCTIONS

|                                                        |     |
|--------------------------------------------------------|-----|
| 1. Legendre polynomials                                | 686 |
| 2. Harmonic polynomials and spherical functions        | 703 |
| 3. Some examples of application of spherical functions | 716 |

## III. CHEBYSHEV-HERMITE AND CHEBYSHEV-LAGUERRE POLYNOMIALS

|                                                 |     |
|-------------------------------------------------|-----|
| 1. Chebyshev-Hermite polynomials                | 725 |
| 2. Chebyshev-Laguerre polynomials               | 728 |
| 3. Simplest problems for Schrödinger's equation | 736 |

|                                                             |     |
|-------------------------------------------------------------|-----|
| TABLES OF THE ERROR INTEGRAL AND SOME CYLINDRICAL FUNCTIONS | 745 |
|-------------------------------------------------------------|-----|

|              |     |
