	PAGE
Author's Preface	v
Translator's Preface	vii
1. Vectors and Matrices	1
Linear Transformations	1
Linear Independence of Vectors	10
2. Generalizations	13
3. The Principal Axis Transformation	20
Unitary Matrices and the Scalar Product	24
The Principal Axis Transformation for Unitary and Hermitian Matrices	26
Real Orthogonal and Symmetric Matrices	29
4. The Elements of Quantum Mechanics	31
5. Perturbation Theory	40
6. Transformation Theory and the Bases for the Statistical Interpre- tation of Quantum Mechanics	47
7. Abstract Group Theory	58
Theorems for Finite Groups	59
Examples of Groups	61
Conjugate Elements and Classes	65
8. Invariant Subgroups	67
The Factor Group	68
Isomorphism and Homomorphism	69
9. The General Theory of Representations	72
10. Continuous Groups	88
11. Representations and Eigenfunctions	102
12. The Algebra of Representation Theory	112
13. The Symmetric Group	124
Appendix to Chapter 13. A Lemma Related to the Symmetric Group	140
14. The Rotation Groups	142

CONTENTS

	PAGE
15. The Three-Dimensional Pure Rotation Group	153
Spherical Harmonics	153
The Homomorphism of the Two-Dimensional Unitary Group onto the Rotation Group	157
The Representations of the Unitary Group	161
The Representations of the Three-Dimensional Pure Rotation Group	166
16. The Representations of the Direct Product	171
17. The Characteristics of Atomic Spectra	177
Eigenvalues and Quantum Numbers	177
The Vector Addition Model	184
Appendix to Chapter 17. A Relationship Among Binomial Coefficients	194
18. Selection Rules and the Splitting of Spectral Lines	195
19. Partial Determination of Eigenfunctions from Their Transformation Properties	210
20. Electron Spin	220
The Physical Basis for the Pauli Theory	220
Invariance of the Description under Spatial Rotation	223
Connection with Representation Theory	227
Appendix to Chapter 20. Linearity and Unitarity of Rotation Operators	233
21. The Total Angular Momentum Quantum Number	237
22. The Fine Structure of Spectral Lines	251
23. Selection and Intensity Rules with Spin	266
The Hönl-Kronig Intensity Formulas	275
The Landé g-Formula	278
The Interval Rule	280
24. Racah Coefficients	284
Conjugate Complex Representations	285
Symmetric Form of the Vector Coupling Coefficients	289
Covariant and Contravariant Vector Coupling Coefficients	292
Racah Coefficients	296
Matrix Elements of Spin-Free Tensor Operators	303
General Two-Sided Tensor Operators	305

CONTENTS	xi
	PAGE
25. The Building-Up Principle	309
26. Time Inversion	325
Time Inversion and Antiunitary Operators	325
Determination of the Time Inversion Operator	329
Transformation of the Eigenfunctions under Antiunitary Operators	333
Reduction of Corepresentations	335
Determination of the Irreducible Corepresentations	340
Consequences of Invariance under Time Inversion	344
27. Physical Interpretation and Classical Limits of Representation	
Coefficients, Three- and Six- <i>j</i> Symbols	349
Representation Coefficients	350
Vector Coupling Coefficients	351
Racah Coefficients	355
Appendix A. Conventions	357
Appendix B. Summary of Formulas	361
Subject Index	365
