<b>Preface</b>	<b>vii</b>
<b>Prologue</b>	<b>xix</b>
<b>Contents of AMS Volume 109</b>	<b>xxvii</b>
<b>1 Banach Spaces and Fixed-Point Theorems</b>	<b>1</b>
1.1 Linear Spaces and Dimension . . . . .	2
1.2 Normed Spaces and Convergence . . . . .	7
1.3 Banach Spaces and the Cauchy Convergence Criterion . . . . .	10
1.4 Open and Closed Sets . . . . .	15
1.5 Operators	16
1.6 The Banach Fixed-Point Theorem and the Iteration Method	18
1.7 Applications to Integral Equations . . . . .	22
1.8 Applications to Ordinary Differential Equations . . . . .	24
1.9 Continuity	26
1.10 Convexity	29
1.11 Compactness	33
1.12 Finite-Dimensional Banach Spaces and Equivalent Norms .	42
1.13 The Minkowski Functional and Homeomorphisms . . . . .	45
1.14 The Brouwer Fixed-Point Theorem . . . . .	53
1.15 The Schauder Fixed-Point Theorem . . . . .	61
1.16 Applications to Integral Equations . . . . .	62
1.17 Applications to Ordinary Differential Equations . . . . .	63

1.18 The Leray–Schauder Principle and a priori Estimates . . . . .	64
1.19 Sub- and Supersolutions, and the Iteration Method in Ordered Banach Spaces . . . . .	66
1.20 Linear Operators . . . . .	70
1.21 The Dual Space . . . . .	74
1.22 Infinite Series in Normed Spaces . . . . .	76
1.23 Banach Algebras and Operator Functions . . . . .	76
1.24 Applications to Linear Differential Equations in Banach Spaces . . . . .	80
1.25 Applications to the Spectrum . . . . .	82
1.26 Density and Approximation . . . . .	84
1.27 Summary of Important Notions . . . . .	88
<b>2 Hilbert Spaces, Orthogonality, and the Dirichlet Principle</b>	<b>101</b>
2.1 Hilbert Spaces	105
2.2 Standard Examples	109
2.3 Bilinear Forms . . . . .	120
2.4 The Main Theorem on Quadratic Variational Problems . . . . .	121
2.5 The Functional Analytic Justification of the Dirichlet Principle . . . . .	125
2.6 The Convergence of the Ritz Method for Quadratic Variational Problems . . . . .	140
2.7 Applications to Boundary-Value Problems, the Method of Finite Elements, and Elasticity . . . . .	145
2.8 Generalized Functions and Linear Functionals . . . . .	156
2.9 Orthogonal Projection . . . . .	165
2.10 Linear Functionals and the Riesz Theorem . . . . .	167
2.11 The Duality Map . . . . .	169
2.12 Duality for Quadratic Variational Problems . . . . .	169
2.13 The Linear Orthogonality Principle . . . . .	172
2.14 Nonlinear Monotone Operators . . . . .	173
2.15 Applications to the Nonlinear Lax–Milgram Theorem and the Nonlinear Orthogonality Principle . . . . .	174
<b>3 Hilbert Spaces and Generalized Fourier Series</b>	<b>195</b>
3.1 Orthonormal Series . . . . .	199
3.2 Applications to Classical Fourier Series . . . . .	203
3.3 The Schmidt Orthogonalization Method . . . . .	207
3.4 Applications to Polynomials . . . . .	208
3.5 Unitary Operators . . . . .	212
3.6 The Extension Principle . . . . .	213
3.7 Applications to the Fourier Transformation . . . . .	214
3.8 The Fourier Transform of Tempered Generalized Functions	219

<b>4 Eigenvalue Problems for Linear Compact Symmetric Operators</b>	<b>229</b>
4.1 Symmetric Operators . . . . .	230
4.2 The Hilbert–Schmidt Theory . . . . .	232
4.3 The Fredholm Alternative . . . . .	237
4.4 Applications to Integral Equations . . . . .	240
4.5 Applications to Boundary-Eigenvalue Value Problems . . . . .	245
<b>5 Self-Adjoint Operators, the Friedrichs Extension and the Partial Differential Equations of Mathematical Physics</b>	<b>253</b>
5.1 Extensions and Embeddings . . . . .	260
5.2 Self-Adjoint Operators . . . . .	263
5.3 The Energetic Space . . . . .	273
5.4 The Energetic Extension . . . . .	279
5.5 The Friedrichs Extension of Symmetric Operators . . . . .	280
5.6 Applications to Boundary-Eigenvalue Problems for the Laplace Equation . . . . .	285
5.7 The Poincaré Inequality and Rellich’s Compactness Theorem	287
5.8 Functions of Self-Adjoint Operators . . . . .	293
5.9 Semigroups, One-Parameter Groups, and Their Physical Relevance . . . . .	298
5.10 Applications to the Heat Equation . . . . .	305
5.11 Applications to the Wave Equation . . . . .	309
5.12 Applications to the Vibrating String and the Fourier Method	315
5.13 Applications to the Schrödinger Equation . . . . .	323
5.14 Applications to Quantum Mechanics . . . . .	327
5.15 Generalized Eigenfunctions . . . . .	343
5.16 Trace Class Operators . . . . .	347
5.17 Applications to Quantum Statistics . . . . .	348
5.18 $C^*$ -Algebras and the Algebraic Approach to Quantum Statistics . . . . .	357
5.19 The Fock Space in Quantum Field Theory and the Pauli Principle . . . . .	363
5.20 A Look at Scattering Theory . . . . .	368
5.21 The Language of Physicists in Quantum Physics and the Justification of the Dirac Calculus . . . . .	373
5.22 The Euclidean Strategy in Quantum Physics . . . . .	379
5.23 Applications to Feynman’s Path Integral . . . . .	385
5.24 The Importance of the Propagator in Quantum Physics . . . . .	394
5.25 A Look at Solitons and Inverse Scattering Theory . . . . .	406
<b>Epilogue</b>	<b>425</b>
<b>Appendix</b>	<b>429</b>

<b>References</b>	<b>443</b>
<b>Hints for Further Reading</b>	<b>455</b>
<b>List of Symbols</b>	<b>459</b>
<b>List of Theorems</b>	<b>465</b>
<b>List of the Most Important Definitions</b>	<b>467</b>
