

CONTENTS

1. **THE ROLE OF ENERGY.** Pattern of energy consumption in industrialized societies. Contrast with nonindustrialized societies. Significant end uses for energy. Basic energy uses in industry and commerce. Basic residential uses. New uses. Rates of growth. 2
2. **THE SOURCES OF ENERGY.** Significant sources classified as solar energy conversion, fossil fuel combustion, nuclear fuel fission. Contrast between 1970 dependence on fossil fuel and 1850 dependence on solar energy in the United States. Major historic substitutions, 1850–1970. Quantitative measures of energy consumed, United States and world. Physical quantities. 10
3. **PROJECTED ENERGY CONSUMPTION.** Per capita consumption in the United States. Projected growth rates for different end uses. Overall projected per capita consumption. Saturation. Growth of total consumption. Other industrialized regions follow the United States. Nonindustrialized regions may not. World total projection. 18
4. **ENERGY RESOURCES.** Solar energy. Mineral fuel reserves viewed as inventory. Classification of resources. Resource estimates. Fossil reserves adequate for 50 years. Resources adequate for 500 years. Uranium and thorium resources adequate for millenia. 26
5. **ECONOMIES OF SCALE AND NEW TECHNOLOGY.** Economy of scale. Tanker example. Coal mining example. Economy of new technology. Experience curves. Examples for gasoline processing and crude oil recovery.

Mineral recovery experience curves with depletion. Example for crude oil. Synthetic crude oil. Estimated experience curve for synthetic crude oil from coal.	38
6. SOCIAL AND ENVIRONMENTAL FACTORS. Migration to the cities. Women's Liberation. Rapid growth of workforce and energy utilization. Environmental movement. Clean Air Act. Analogy to Pure Food and Drug laws. Impact on energy industries. Switch from coal to oil. Nuclear delays. Substitution of gas turbines. Contribution to energy crisis. Lasting effects of the environmental movement.	52
7. POLITICAL FACTORS. United States oil industry. Marginal producers. Impact of new discovery on marginal producers. Small discovery example. Alaska-type example. Middle Eastern-type example. History of Middle Eastern oil. OPEC. Desire of OPEC to limit production and maintain prices. Desire of United States and Europe to limit imports, maintain prices, protect domestic fuels. Interests of consumers.	62
8. AVAILABILITY OF FUELS. Recapitulation of United States energy crisis. Long-term results of environmental factors. Refined fuel and land reclamation. Contribution of political factors. United States energy policy. Protection of energy industry infrastructure. Tariff and quota model. United States marginal producer determines price. Balance of payments. United States bargaining power. Long-term price trend.	68
9. ROLE OF ELECTRICITY. Electricity as refined energy. End uses for electricity. Electrified end uses: stationary work, illumination, electronics. Unelectrified end uses: process steam, transportation. Partially electrified end uses: heat. Significance of efficiency.	76
10. EFFICIENCY OF ENERGY UTILIZATION. Heat and work. Efficiency. Reversible heat engine. Heat pump. Theoretical heat engine efficiency. Waste heat. Electricity equivalent to work. Comparison of electric motor and diesel engine. Electric illumination and oil lamp. Electric heat and combustion heat. Heat pump performance.	82
11. PROGRESS OF ELECTRIFICATION. Worldwide growth of electricity. Electricity substitutes for combustion on the premises. Efficiency trajectory. Price trajectory. Electric utility industry. Electrification measured by fuel input and by electric output. Projection by classes of end uses. Projections of fuel input and electric output. Significance of improved efficiencies of conversion and use.	92
12. ELECTRIC GENERATION TECHNOLOGIES. Conversion of heat, chemical energy or solar radiation into electricity. Major generation technologies: hydroelectric, fossil-fuel steam, gas turbine, nuclear steam. Special situ-	

ation technologies: diesel, geothermal, agricultural, solar cells, batteries, fuel cells. New technologies: AGR, heavy-water reactor, HTGR, LMFBR, gas turbine combined cycle. Laboratory demonstrations. Theoretical possibility.	106
13. FACTORS AFFECTING THE COST OF ELECTRICITY. Major cost elements. Cost of fuel. High-sulfur coal versus low-sulfur coal. Internalization of social costs. Economic value of efficiency. Generation capital costs and fixed charges. Significance of availability. Interest during construction. Significance of delay. Underground transmission. Economic comparison of nuclear steam, fossil-fuel steam, gas turbine generation. Low-cost oil comparison.	116
14. COMPARISON OF FOSSIL FUEL, NUCLEAR, AND SOLAR ELECTRICITY. Significance of noneconomic factors. Energy industry infrastructure protection. Environment protection. Energy consumption and fuel price projections. Field construction costs. Solar energy collection via agricultural products. Cost comparison for fossil, nuclear, and solar electric generation. Potential technological advances. Hypothetical future cost comparison.	130
15. ENERGY CRISES IN PERSPECTIVE. Recapitulation.	140
