TRANSLATION EDITOR'S FOREWORD . . . . .	v
FOREWORD TO THE ENGLISH EDITION . . . . .	vii
FOREWORD	ix
INTRODUCTION	xvii
CHAPTER I. FORMULATION OF THE PROBLEM . . . . .	1
1. The physical model of a process. The fundamental equations of the problem. Conditions for uniqueness of solution	1
2. The constant parameters of a problem . . . . .	13
CHAPTER II. GENERALIZED VARIABLES . . . . .	19
3. The relationships between constant parameters and operators	19
4. Investigation of problems in terms of relative variables and dimensionless groups. Generalized treatment . . .	29
5. The generalized individual case as a group of similar phenomena. Criteria of similarity. Generalized equations	35
6. Combination of criteria and relative variables. Criteria of the parametric type. The form of dimensionless variables	39
7. The possibilities and objectives of generalized analysis	45
CHAPTER III. SOME BOUNDARY-VALUE PROBLEMS . . . . .	48
8. Processes in continuous-media and boundary-value problems	48

<b>A. The Temperature Field in a Solid</b>	
9. The initial physical concepts and mathematical statement of the problem of the temperature field in a solid body. General form for representing the temperature field	52
10. Homogeneous operators and their reduction . . . . .	63
11. The Fourier number and its physical significance. Homochronicity	67
12. The Biot number: its physical structure and representation. Quantitative evaluations based on the Biot number. Degeneration of groups . . . . .	70
13. Monotonically varying temperature fields. The Fourier number as a dimensionless form of time. One-dimensional fields	83
14. Steady-state temperature distribution in plates. Thermal conductivity and thermal resistance. New aspects of the Biot number	90
15. The temperature field of a body of infinite dimensions. Combination of independent variables . . . . .	94
16. The temperature field in a body with a distributed heat source. Dimensionless groups involving temperature. The case of solutions which are complete except for a numerical constant	96
<b>B. The Motion of a Continuous Medium</b>	
17. Physical representation. System of fundamental equations. Conditions for uniqueness of solution . . . . .	101
18. Forced flow. Dimensionless groups. Homochronicity group and Reynolds and Froude numbers. The Euler number	112
19. The physical significance of the Reynolds number. Laminar and turbulent flow regimes. Molecular and eddy transfer mechanisms . . . . .	116
20. The general form of the dimensionless relationships for various cases of forced motion of incompressible fluids. Pure forced motion. Degeneration of the Reynolds number. Self-similarity . . . . .	122
21. Steady-state flow of an incompressible fluid in a tube. Flow stabilization. The velocity profile. Hydraulic resistance. Role of the Reynolds number. Velocity and hydraulic resistance. The range of self-similarity. Fully developed laminar flow . . . . .	125
22. Free flow. Special features in setting up the problem and transforming the groups. The Galileo and Archimedes numbers. Thermal convection. The Grashof number	142

C. Heat Transfer in Moving Media	
23. The mechanism of heat transfer in moving fluids. System of fundamental equations . . . . .	149
24. The dimensionless groups for the problem of heat transfer in moving fluids. Relationships between the Péclet and Reynolds numbers. The Prandtl number and its physical significance. General form of the temperature field equation under forced flow conditions . . . . .	154
25. The temperature field equation under free flow conditions. Degeneration and amalgamation of groups. Turbulence during thermal convection . . . . .	159
26. Heat transfer between a moving fluid and a solid. Dimensionless form of the heat transfer coefficient. The Nusselt number. General form of the equation for the intensity of heat transfer . . . . .	164
27. Effect of variable physical properties. Statement of the problem. The temperature factor. The method of characteristic temperatures. The effect of the heat flux direction . . . . .	170
28. The case of heat fluxes given by the conditions. The dimensionless form of temperature . . . . .	179
CHAPTER IV. SIMILARITY	181
A. Similar Transformations	
29. The similarity of phenomena and similar transformations. Transformation factors for differential operators . . . . .	181
30. The invariance of equations with respect to similar transformations. Homogeneity. Absolutely and conditionally homogeneous functions. The number of degrees of freedom . . . . .	187
31. The necessary and sufficient conditions for similarity . . . . .	194
B. The Method of Models	
32. Essential features of the method of models. The arrangement of experiments and limiting conditions. . . . .	197
33. Approximate modeling. The degeneration of similarity groups as an effect which increases gradually. Approximate similarity. The degree of distortion due to the approximation . . . . .	205
34. The method of analogies. The generalized case and the physical homogeneity of phenomena. Physical analogies. Analogous transformations . . . . .	211

CHAPTER V. DIMENSIONAL ANALYSIS 219

35. Various forms of generalized analysis and their dependence on the quantity of preliminary information available 219

36. The transition from a qualitative description of a process to a quantitative investigation. Numerical values of the quantities. The operation of coupling quantities with numbers. Primary and secondary quantities 221

37. The determining equations. The principle of absolute-ness of ratios and the structure of the determining equations 225

38. Dimensions. The formula of dimensionality. Dimensionless quantities. The invariance of dimensionless quantities with respect to metric transformations . . . 230

39. The  $\pi$  theorem 234

40. The constants of the determining equations. Fundamental and derived units. Dimensional constants. The combination of dimensionality formulas and systems of units of measurement 238

41. The application of the apparatus of dimensional analysis to the construction of generalized variables. The dimensionality formula as a form of representing the reduced groups for the determining equations . . . . . 246

42. The relationship between the theory of similarity and dimensional analysis 251

SUBJECT INDEX 255
