

Volume II

Contents

I THE AGE OF RUTHERFORD

H. Becquerel discovers a New Property of Uranium	1
Rutherford identifies Alpha and Beta Rays	2
The Curies discover Polonium and Radium	2
Villard observes Gamma Rays	3
Rutherford and Soddy's Theory of Radio-activity	5
Rutherford proves that Alpha Particles are Helium Atoms	7
The Discovery of Isotopes	11
Lead as the Final Product of Radio-activity	13
Barkla detects the Polarisation of X-rays	14
He discovers the K- and L-Series	16
Bragg shows that the Velocity of the Electrons produced by X-rays reaches the Velocity of the Primary Electrons of the X-ray Tube	17
Laue suggests that Crystals might diffract X-rays	18
Rutherford discovers the Structure of the Atom	22
Moseley proves that the Number of Electrons which circulate round the Nucleus of an Atom is equal to the Ordinal Number of the Element in the Periodic Table	24
Rutherford disintegrates Atoms by bombarding them	26

II THE RELATIVITY THEORY OF POINCARÉ AND LORENTZ

Relative Motion of Earth and Aether	27
The Body Alpha	28
Trouton's Experiment	29
The Search for Double Refraction due to the Earth's Motion	29
Poincaré enunciates the Principle of Relativity	30
The Lorentz Transformation	31
The Electric and Magnetic Forces constitute a Six-vector	35
Paradoxical Consequences of the New Theory	36
The Relativist View of the Fitzgerald Contraction	37
No Velocity can exceed the Velocity of Light	38
Poincaré discovers the Behaviour of Electric Charge and Current under the Lorentz Transformation	39
Einstein gives the Relativist Formulae for Aberration and the Doppler Effect	40
The Transverse Doppler Effect	42
The Vibrations of a Rotating Rod	43
The Rate of Disintegration of Mesons	44
Planck discovers Relativist Dynamics	44
The Relativist Kinetic Energy and Momentum of a Particle	46
Lewis and Tolman's Proof	48
The Connection of Mass with Energy	51
Planck's New Definition of Momentum	54
The Bent Lever of Lewis and Tolman	55
Felix Klein's Definition of a Vector	56
The Tensor-calculus of Ricci	58

CONTENTS

Metric of a Space	• 62
Minkowski and Hargreaves introduce Space-time	• 64
Minkowski discovers the Energy-tensor	• 66
His treatment of Relativist Dynamics	• 68
Relativist force on a Charged Particle	• 71
Connection of the Energy-tensor and the Energy-momentum Vector	• 72
The Electromagnetic Potential-vector	• 75
The Energy-tensor in terms of the Lagrangean Function	• 76

III THE BEGINNINGS OF QUANTUM THEORY

Planck's discovery of the Formula for Pure-temperature Radiation	• 78
His Theoretical Justification for it	• 81
He determines various Fundamental Constants	• 84
His More Accurate Formulation of the Stefan-Boltzmann Law	• 85
A Later Proof of Planck's Law	• 86
Einstein introduces Photons	• 87
His Theory of Photo-electricity	• 89
Photo-chemical Decomposition	• 91
Momentum of a Photon	• 91
Corpuscular Derivation of the Doppler Effect	• 92
The Wave and Particle Theories of Light	• 93
Thomson's Concept of Needle Radiation	• 94
Einstein's Application of Quantum Theory to Specific Heats of Solids	• 96
Molecular Heat of Gases	• 100
Einstein's Formula for Fluctuations in the Energy of Radiation	• 101
Planck's Second Theory of Radiation	• 103
His Third Theory	• 104
Sommerfeld connects Quantum Theory with Hamilton's Theory of Action	• 104

IV SPECTROSCOPY IN THE OLDER QUANTUM THEORY

Conway discovers the correct Principle for the Interpretation of Spectra	• 106
Nicholson makes use of the Rutherford Atom and Quantum Rules	• 107
Bjerrum's work on Molecular Spectra	• 108
Ehrenfest states the Law of Quantification of Angular Momentum	• 109
Bohr's Theory of the Balmer Series of Hydrogen	• 110
Pickering's ζ Puppis Series	• 113
A. Fowler's work on the Spectra of Ionised Atoms	• 115
The Stark Effect	• 117
The Wilson-Sommersfeld Conditions for Quantification	• 118
Sommersfeld's Elliptic Orbits	• 119
Schwarzschild and Epstein's Theory of the Stark Effect	• 121
Adiabatic Invariants	• 122
Systems in which the Variables can be Separated	• 126
Sommersfeld and Debye's Quantum Theory of the Zeeman Effect	• 128
Space Quantification : the Stern-Gerlach Effect	• 130
Selection-principles	• 131
The Inner Quantum Number	• 133
The Spin of the Electron	• 134
The Paschen-Back Effect and the Anomalous Zeeman Effect	• 135
The Structure of the Atom	• 137

CONTENTS

X-ray Spectra	• 138
The Element Hafnium	• 140
Stoner and Main Smith's Theory of Electron-shells	• 141
Pauli's Exclusion Principle	• 142
Duane's Quantum Theory of Diffraction by a Grating	• 142

V GRAVITATION

Difficulties connected with the Newtonian Law	• 144
The Secular Inequality of Jupiter and Saturn	• 145
The Secular Acceleration of the Mean Motion of the Moon	• 146
Other Anomalies in the Solar System	• 148
Lorentz's <i>Considerations on Gravitation</i>	• 149
Einstein's Principle of Equivalence	• 152
Theories of Abraham and Mie	• 153
Bateman's Introduction of the General Metric	• 154
Einstein abandons the Scalar Potential-function	• 156
The Generalised Maxwell's Equations	• 160
The General Relativity of 1915	• 166
Connection of the Einsteinian and Newtonian Theories	• 168
Hilbert's World-function	• 170
Whitehead's Theory	• 174
Schwarzschild's Solution for a Single Massive Particle	• 175
Observational Tests of General Relativity	• 179
Walker's Model	• 181
Einstein introduces the λ-term	• 183
The de Sitter World	• 184
The Concept of Spatial Distance	• 186
The Expanding Universe	• 188
Weyl's Geometry	• 188
Parallel Transport	• 189
The Five-dimensional Theory of Relativity	• 191
Attempts to construct a Physics independent of Geometry	• 192

VI RADIATION AND ATOMS IN THE OLDER QUANTUM THEORY

Einstein's Theory of the Exchanges of Energy between Radiation and Molecules	• 197
Ladenburg's Introduction of Quantum Concepts into the Dispersion and Scattering of Light	• 200
The Smekal-Raman Effect	• 205
The Kramers-Heisenberg Theory of Scattering	• 206
Discovery of the Compton Effect	• 208
The Bohr-Kramers-Slater Hypothesis	• 211
L. de Broglie's Association of Waves with the Motion of a Particle	• 214
Interference and Diffraction as Quantum Effects	• 216
Davisson and Germer discover Diffraction Effects with Reflected Electrons	• 218
Bose's Statistics	• 219
Fermi's Statistics	• 224
Astrophysical Application of Fermi Statistics	• 228
Sommerfeld's Theory of Electrons in Metals	• 230
Thermionics and Photoelectricity in the Twentieth Century	• 233
The Extraction of Electrons from Cold Metals by Intense Electric Fields	• 236

CONTENTS

VII MAGNETISM AND ELECTROMAGNETISM, 1900-1926

Langevin's Application of Electron-theory to Magnetism	• 239
The Bohr Magneton	• 242
Tolman and Stewart's Experiment	• 243
Barnett's Experiment	• 243
The Richardson Effects in Magnetisation	• 244
Problems related to Unipolar Induction	• 245
Field due to a Moving Electron	• 246
Leigh Page's Deduction of the Maxwellian Theory	• 247
Cunningham's Theory of Electromagnetic Actions	• 248
The Emission Theory of Electromagnetism	• 249
Leathem's Phenomenon	• 249
Hargreaves' Integral-form of the Maxwell-Lorentz Theory	• 250
His Values for the Potentials of a Moving Electron	• 252

VIII THE DISCOVERY OF MATRIX-MECHANICS

Heisenberg's Foundation of Quantum-mechanics on the Virtual Orchestra	253
His Introduction of Non-commutative Multiplication	• 255
Matrix-theory	• 256
The Energy Matrix is Diagonal	• 259
The Commutation Rule	• 260
Born and Jordan's Solution for the Harmonic Oscillator	• 261
The Paper of Born, Heisenberg and Jordan	• 263
Dirac's Approach to the Problem	• 265
To Every Physical Quantity there corresponds an Operator	• 267

IX THE DISCOVERY OF WAVE-MECHANICS

De Broglie's Principle embodied in Partial Differential Equations	268
Schrödinger's Equation : Connection with Hamilton's Principal Function	270
Quantification as a Problem of Proper Values	• 272
The Hydrogen Atom treated by Wave-mechanics	• 273
Physical Significance of the Wave-function	• 275
Normalisation and Orthogonality of Wave-functions	• 276
The General Wave-equation	• 278
Rigorous Equivalence of Schrödinger's and Hamilton's Equations	• 279
The Wentzel-Kramers-Brillouin Approximation	• 282
Superposition of States	• 283
Connection of Wave-mechanics with Matrix-mechanics	• 285
The Harmonic Oscillator treated by Wave-mechanics	• 288
Wave-packets	• 290
The Quantum Theory of Collisions	• 291
The Treatment of Perturbations	• 296
The Stark Effect treated by Wave-mechanics	• 297
The Wave-mechanical Theory of the Zeeman Effect	• 300
Schrödinger's Derivation of the Kramers-Heisenberg Formula for Scattering	• 302
Wave-explanation of the Compton-effect	• 305
Systems containing Several Identical Particles	• 306
NAME INDEX	• 309
SUBJECT INDEX	• 315
