

Contents

Chapter 1. Elements of Information Theory	1
1.1 Proposition and Probability, 1	
1.2 Surprise, Ignorance, and Information, 8	
1.3 Some Mathematical Properties of Entropy Functions, 15	
1.4 Acquisition of Information through Successive Polychotomic Observation, 27	
1.5 Optimal m -Bounded Polychotomic Tree and “Noiseless” Coding, 37	
Chapter 2. Structure Analysis	49
2.1 Organization of Individuals in an Assembly, 49	
2.2 IDA (Interdependence Analysis) and Multiplicative Polychotomic Trees, 52	
2.3 Simple Illustration of IDA—Structure of Abstract Patterns, 61	
2.4 Probabilistic Dependence in Stationary Stochastic Chains, 66	
2.5 IDA in Stochastic Chains, 76	
2.6 Effect of Coarse Observation on Interdependence, 90	
Chapter 3. Prediction and Retrodiction	103
3.1 Fundamental Asymmetry in Probabilistic Inference—Some Basic Theorems, 103	

- 3.2 Origin of Asymmetry in Prediction and Retrodiction in Physics—Causality and Freedom, 114
- 3.3 Concept of Information Balance, 126

Chapter 4. Deduction and Induction 133

- 4.1 Verifiable Propositions, Hypotheses, and Experiential Propositions, 133
- 4.2 Probabilistic Deduction—Probabilistic Experiential Propositions, 142
- 4.3 Probabilistic Induction—Confirmation and Creditation, 154
- 4.4 Deduction and Induction as Prediction and Retrodiction—Mathematical Model of Induction, 163
- 4.5 Classical Paradoxes, 178

Chapter 5. Deduction and Observation—*H*-Theorem and Negentropy Principle 194

- 5.1 Information Balance in Deduction, 194
- 5.2 Mathematical Proofs of *H*-Theorems and the Markov Chain, 209
- 5.3 The *H*-Theorem in Deduction and Observation, 237
- 5.4 Thermodynamic Cost of Observation and Brillouin's Negentropy Principle, 245

Chapter 6. Induction and Learning—Inverse *H*-Theorem 255

- 6.1 Information Balance in Induction, 255
- 6.2 Mathematical Proof of the Inverse *H*-Theorem and the Bayesian Chain, 262
- 6.3 Additional Remarks and Computer Simulation, 274
- 6.4 Inverse *H*-Theorem in Behavioral Learning Processes, 286

Chapter 7. Logic and Probability 299

- 7.1 Propositional Lattices, 299
- 7.2 Spectral Decomposition, Atoms, and Truth Value, 320
- 7.3 Formal Concept of Probability, 333
- 7.4 Empirical Interpretation of Probability, 347
- 7.5 Structure of the Object-Predicate Table, Extension, Intension, and Complexity, 362
- 7.6 Theorem of the Ugly Duckling, 376

Chapter 8. Classes and Concepts **380**

- 8.1 Cognition and Recognition, 380
- 8.2 Preselection of Variables—SELFIC, 388
- 8.3 Entropic Measure of Similarity and Cohesion, 403
- 8.4 Algorithm of Clustering, 418
- 8.5 Decision Procedures in Recognition, 434

Chapter 9. Non-Boolean Information Theory **449**

- 9.1 Modular Lattice, 449
- 9.2 Projection Operators, 465
- 9.3 Empirical Background for Non-Boolean Logic, 478
- 9.4 Theoretical Scaffold of Quantum Mechanics, 496
- 9.5 Non-Boolean Information Theory in Quantum Physics, 513

Appendices **531**

- A1.1 Use of Relative Entropy to Avoid Negative Information, 531
- A3.1 Remarks on Conditional Probabilities, 553
- A4.1 Church's Objection to Ayer, 534
- A5.1 Proof of Theorem 5.1, 535
- A7.1 Toda's Methods of Measurement of Subjective Probabilities, 536
- A7.2 Proposition Calculus, 540
- A8.1 Complex Linear Algebra, 542
- A8.2 Proof of Theorem 8.1 for a Degenerate Case, 543
- A8.3 Proof of Theorem 8.4, 544
- A8.4 Proof of Theorem 8.5, 545
- A8.5 Factor Analysis, 547
- A8.6 The So-Called Perceptron Convergence Theorem, 552
- A9.1 Simultaneous Diagonalization of Commuting Projection Operators, 558
- A9.2 Non-Commuting Projection Operators, 559
- A9.3 Planck's Constant and the Commutation Relation, 563
- A9.4 Proof of the Generalized Gibbs Theorem, 567
- A9.5 Entropies in Optical Channels, 569
