

CONTENTS

Preface	vii
1 The basic equations of fluid mechanics	
1-1 Generalities	1
1-2 Vectors	5
1-3 Tensors	9
1-4 Differentiation of scalars, vectors, and tensors	18
1-5 Frames of reference and coordinate systems	24
1-6 The equation of continuity	29
1-7 The dynamical equation	32
1-8 Pressure	35
1-9 Special forms of the dynamical equation	36
1-10 Energy equations	38
2 Purely viscous non-Newtonian constitutive equations	
2-1 Viscosity of real fluids	43
2-2 Requirements of objectivity for constitutive equations	46
2-3 Reiner–Rivlin fluids	50

2-4	Generalized Newtonian fluids	54
2-5	Laminar flow of generalized Newtonian fluid	56
2-6	The concept of memory for fluid-like materials	60
2-7	Further useful relations of tensor algebra	63
2-8	Illustrations	70
3	Kinematics	
3-1	Deformation and strain	78
3-2	Histories. Time derivatives. Rates of strain	85
3-3	Transformation of tensors and their time derivatives under a change of frame	91
3-4	The convected coordinates approach	98
3-5	Constant stretch history flows	103
3-6	Illustrations	109
4	Simple fluid theory	
4-1	The simple fluid concept	117
4-2	Functionals and the principle of fading memory	121
4-3	Simple fluids with fading memory. Mechanical theory	128
4-4	Thermodynamics	133
5	Rheometrical flow systems	
5-1	Introduction	153
5-2	Viscometric flows	163
5-3	Extensional flows	177
5-4	Periodic flows	180
6	Constitutive equations	
6-1	Classification	196
6-2	Differential equations	198
6-3	Integral equations	201
6-4	Rate equations	215
6-5	Illustrations	229
7	Fluid mechanics	
7-1	Flow classification	235
7-2	Dimensional analysis	245
7-3	Secondary and superimposed flows	252
7-4	Flows around submerged objects and boundary layers	256
7-5	Turbulent flows	261
7-6	Extensional flows	268
7-7	Waves and instability	273
	Index	281
