

## CONTENTS

Foreword	vii
I. Onset of Convection	1
II. Near the Onset	14
2.1 Amplitude Equation	14
2.2 Wavelength Selection	23
2.3 The Nonlinear State	26
2.4 Instabilities of the Convection State	30
III. Lorenz Model	37
IV. Characteristics of Chaos	52
V. Routes to Chaos	65
5.1 Introduction and Period-Doubling	65
5.2 Intermittency	84
5.3 Quasiperiodicity to Chaos	90
VI. On Experiments	101
6.1 Onset of Convection	101
6.2 $R > R_c$	102
6.3 Wavelength Selection	105
6.4 Transition to Chaos	108
6.5 Turbulence near Onset of Convection	123
VII. In a Magnetic Field	129
VIII. Thermohaline Convection	145
8.1 Introduction	145
8.2 Linear Stability Analysis	146
8.3 Nonlinear Effects	154

x

8.4	Truncated System	165
8.5	Effect of Sidewalls on Threshold	170
8.6	Travelling Wave Instability	172
IX.	Binary Liquids	175
9.1	Introduction	175
9.2	Linear Stability Analysis	178
9.3	Five-mode Truncation	187
9.4	Eight-mode Truncation	196
9.5	Experiments	198
X.	Couette-Taylor Flow	203
10.1	Introduction	203
10.2	Perturbation Equations	207
10.3	Critical Taylor Number	211
10.4	$T > T_c$	212
10.5	Tricritical Point	215
XI.	Modulated Systems	219
11.1	Introduction	219
11.2	Single-component Fluid	220
11.3	Binary Liquids	229
11.4	Couette-Taylor Flow	234
XII.	Fully Developed Turbulence	239
