PREFACE xv

Part I. **Tensor Analysis**

A. Cemal Eringen

Introduction 2

1. TENSOR ALGEBRA 4

1.1. Scope of the Section 4
1.2. Curvilinear Coordinates 4
1.3. Affine Geometry 6
1.4. Vector Space 11
1.5. Geometric Objects 14
1.6. Scalars, Vectors, and Tensors 16
1.7. Base Vectors and Reciprocal Bases 20
1.8. Tensor Algebra 27
1.9. Multivectors 32
1.10. Second-Order Tensors 39
1.11. Normal Form of Symmetric Tensors 46
1.12. Normal Form of a Bivector 52

2. TENSOR ANALYSIS 55

2.1. Scope of the Section 55
2.2. Metric Tensor 56
2.3. Anholonomic Components of Tensors 63
2.4. Physical Components of Tensors 64
2.5. Covariant Differentiation 68
2.6. Invariant Differential Operators 73
2.7. Intrinsic Differentiation 77
2.8. The Lie Derivative 82
2.9. The Riemann–Christoffel Tensor 87

3. GEOMETRY OF SUBSPACES 90

3.1. Scope of the Section 90
3.2. Curvilinear Coordinates for a Surface in $\mathscr{E}_3$ 91
3.3. Subspace $\mathscr{X}_m$ of $\mathscr{X}_n$ 96
3.4. Sections and Reductions of Tensors 99
3.5. Total Covariant Differentiation 105
3.6. Curves in Space 108
3.7. Hypersurface $\mathscr{X}_{n-1}$ in R_n 113
3.8. The Volume of $\mathscr{X}_m$ in $\mathscr{X}_n$ 118
3.9. Stokes' Theorem 121

4. NONRIEMANNIAN GEOMETRY 126

4.1. Scope of the Section 126
4.2. Affine Connection 127
4.3. Geodesics 133
4.4. Curvature 134
4.5. Some Identities Involving the Curvature Tensor 138
4.6. Covariant Differentiation and Curvature Tensor in Anholonomic Coordinates 139

5. GEOMETRY OF FINSLER 141

5.1. Scope of the Section 141
5.2. Finsler Spaces 141
5.3. Metric Tensor Derivable from a Function 143
5.4. Covariant Differentiation 147
5.5. Torsion and Curvature Tensor 149

REFERENCES 153

Part II. **Group Theory**

Alfred W. Jones

Introduction 157

1. GROUPS AND SEMIGROUPS 158

2. LATTICES AND MORPHISMS 176

3. LIE GROUPS 184

4. LINEAR ALGEBRAS, FROBENIUS AND LIE 192

5. CRYSTALLOGRAPHIC GROUPS 197

REFERENCES 236

Part III. **Theory of Invariants**

A. J. M. Spencer

1. INTRODUCTION 240

1.1. Invariants of Vectors and Tensors 242

1.2. Reducible and Irreducible Invariants; Integrity Bases 245
1.3. Results from Classical Theory 246
1.4. The Orthogonal Groups and Certain Subgroups 250

2. Isotropy 256

2.1. Integrity Bases for Vectors 256
2.2. Isotropic Tensors 259
2.3. Invariants of Vectors and Second-Order Tensors; General Forms 261
2.4. Results concerning Traces of Matrix Polynomials 262
2.5. Invariants of Symmetric Second-Order Tensors 268
2.6. Invariants of Vector and Symmetric Second-Order Tensors; Proper Orthogonal Group 275
2.7. Full Orthogonal Group; Invariants of Vectors and Second-Order Tensors 289

3. Transverse Isotropy 292

3.1. Invariants of Vectors and Tensors; General Forms 294
3.2. Relations for Matrix Polynomials in 2×2 Matrices 296
3.3. Invariants of Symmetric Second-Order Tensors 297
3.4. Invariants of Symmetric Second-Order Tensors and Vectors 299
3.5. Syzygies for the Invariants 303

4. The Crystal Classes 307

4.1. Theorems concerning Integrity Bases 308
4.2. Invariants of a Symmetric Tensor 310
4.3. Syzygies between the Invariants of a Symmetric Tensor 314
4.4. Invariants of a Symmetric Tensor and a Vector 316
4.5. Invariants of an Arbitrary Number of Vectors 318

5. Tensor Polynomial Functions of Vectors and Tensors 320

5.1. General Statements 320
5.2. Examples of Tensor and Vector Polynomial Functions; Proper Orthogonal Transformation Group 323
5.3. Examples of Tensor and Vector Polynomial Functions; Full Orthogonal Transformation Group 329

6. Invariant Functionals; Vector and Tensor Functionals 334

6.1. General Statements 334
6.2. Differential Approximations to Functionals 336
6.3. Integral Approximations to Functionals 336

7. Minimality of the Integrity Bases 337

7.1. The Number of Linearly Independent Invariants 338
7.2. Method of Demonstrating Minimality of an Integrity Basis 347
7.3. Minimality of Integrity Bases. The Crystal Classes 349
7.4. Minimality of Integrity Bases. Full and Proper Orthogonal Groups 349

8. Nonpolynomial Invariants 350

8.1. Nonpolynomial Invariants 350

References 352

Part IV. **Functional Analysis**

Ian N. Sneddon

INTRODUCTION 356

1. SET THEORY 357

1.1. Notation 357
1.2. The Algebra of Sets 358
1.3. Mappings 360
1.4. Countable Sets 365
1.5. Classes of Subsets 366
1.6. Set Functions 369

2. VECTOR SPACES 372

2.1. Definition of a Vector Space 373
2.2. Linear Mappings 374
2.3. The Algebraic Dual of a Vector Space 375
2.4. Convex Sets in a Vector Space 375
2.5. Maximal Subspaces and Hyperplanes 378
2.6. Linear Transformations from R^n into R^m in Terms of Coordinates 378

3. TOPOLOGICAL SPACES 380

3.1. Open Sets 380
3.2. Closed Sets 383
3.3. Metric Spaces 385
3.4. Continuous Mappings 387
3.5. Hausdorff Spaces 388
3.6. Compact Sets 390
3.7. Complete Metric Spaces 393
3.8. Homeomorphisms 398

4. TOPOLOGICAL VECTOR SPACES 400

4.1. Definition of a Topological Vector Space 401
4.2. Normed Vector Spaces 402
4.3. Vector Subspaces 408
4.4. Banach Spaces 409
4.5. Finite-Dimensional Normed Spaces 413
4.6. Hilbert Spaces 416
4.7. Locally Convex Spaces 437

5. SPECTRAL THEORY OF LINEAR OPERATORS 440

5.1. The Spectrum of an Operator 440
5.2. Normal Operators in a Hilbert Space 441
5.3. Self-Adjoint Operators in a Hilbert Space 441
5.4. Compact Symmetric Operators in a Hilbert Space 444

6. DIFFERENTIAL CALCULUS 445

6.1. The Gateaux Derivative 446
6.2. The Fréchet Derivative 447

6.3. The Chain Rule 448
6.4. Newton's Method 450
6.5. Higher Derivatives 451
6.6. Differentiable Manifolds 451

7. Distributions 453

7.1. The Space of Test Functions 455
7.2. Distributions 458
7.3. Examples of Distributions 459
7.4. Differentiation of Distributions 461
7.5. Multiplication of Distributions 468
7.6. Distributions with Compact Support 469
7.7. Tensor Product of Distributions 469
7.8. Convolution of Distributions 470
7.9. Fourier Transforms 472
7.10. Sobolev Spaces 475

Appendix: The Lebesgue Integral 476

A.1. Lebesgue Measure 476
A.2. The Lebesgue Integral 479
A.3. Properties of the Lebesgue Integral 481
A.4. The L^p-Spaces 485

References 487

Part V. **Analytic Function Theory**

L. C. Woods

1. Cauchy Integrals 492

1.1. Introduction 492
1.2. Cauchy's Theorem and Integral Formula 495
1.3. Singularities: The Residue Theorem 498
1.4. The Point at Infinity 501
1.5. Cauchy Principal Values 504
1.6. The Riemann–Stieltjes Integral: The Delta Function 508
1.7. The Plemelj Formulas 510
1.8. Contour Passing through the Point at Infinity 512
1.9. Inversion Formulas: The Poincaré–Bertrand Formula 514
1.10. Singularities of the Contour C 517

2. The Fundamental Problems of Potential Theory 519

2.1. The Dirichlet and Neumann Problems 519
2.2. Solutions of the Fundamental Problems for a Circle 521
2.3. The Reflection Principle 525
2.4. Solutions of the Fundamental Problems for an Infinite Strip 527
2.5. Simply Mixed Boundary Conditions for a Strip 530
2.6. Periodic Boundary Conditions 532
2.7. Periodic Boundary Conditions for the Infinite Strip 536
2.8. The Solution of the Fundamental Problems for the Rectangle 539

2.9. Uniqueness of Solutions to the Dirichlet Problem 541
2.10. Reduction of the Dirichlet Problem to an Integral Equation 544
2.11. Green's Function 548

3. Conformal Mapping 552

3.1. General Principles 552
3.2. The Schwarz–Christoffel Mapping Theorem 556
3.3. An Integral Equation for Mapping on the Upper Half Plane 561
3.4. Generalizations of the S–C Mapping Theorem 563
3.5. The Mapping of Nearly Circular Domains 567
3.6. The Mapping of Doubly Connected Regions 569
3.7. Green's Function and Conformal Mapping 571
3.8. The Kernel Function 573
3.9. Mapping and Fluid Dynamics 575
3.10. Practical Methods of Constructing Conformal Maps 577

4. The Hilbert Problem and Applications 578

4.1. The Hilbert Problem 578
4.2. The Riemann–Hilbert Problem for Single-Connected Domains 580
4.3. An Alternative Treatment of the Riemann–Hilbert Problem 584
4.4. The Riemann–Hilbert Problem with Discontinuous Coefficients 586
4.5. Inversion Formulas for Arcs 590
4.6. Singular Integral Equations 591
4.7. The Poincaré Problem 596
4.8. The Wiener–Hopf Technique 598

References 602

Part VI. **Elements of Stochastic Processes**

J. Clifton Samuels

1. Introduction 606

1.1. Some Applications of the Theory of Stochastic Processes 606
1.2. Historical Development of the Mathematical Theory of Stochastic Processes 607
1.3. Scope of This Work 608
1.4. Physical Description of Random Processes 608
1.5. Mathematical Description of Random Processes 610
1.6. Random Functions of Several Independent Variables 612
1.7. Random Tensors 612
1.8. Classification of Random Functions 613

2. Calculus and Second-Order Properties of Random Functions 613

2.1. Stochastic Limits and Modes of Convergence 613
2.2. Regular Random Functions 615
2.3. Continuity of Random Functions 615
2.4. Differentiability of Random Functions 616
2.5. Integration of Random Functions 617
2.6. Theorems on Stochastic Differentiation and Integration 618

2.7. Autocovariance and Autocorrelation Functions 619
2.8. Spectral Density Function 626
2.9. Orthogonal Expansions of Random Function 633
2.10. Fourier Analysis of Stationary Processes 637
2.11. The Gaussian Random Process, Definitions 638
2.12. Theorems and Results 639

3. Differential Equations for Distribution Functions of Stochastic Processes and Some Special Properties of Stochastic Processes 641

3.1. Differential Equation for the Characteristic and Distribution Functions of Physical Processes (Sufficiently Smooth Processes) 641
3.2. Markoff Processes 647
3.3. Expected Number of Zeros per Unit of Time 650
3.4. Expected Number of Maxima per Unit of Time 653
3.5. Other Properties of Interest 654

4. Stochastic Boundary and Initial Value Problems 654

4.1. Formulation of Boundary and Initial Value Problems under Stochastic Conditions 655
4.2. Stochastic Ordinary Differential Equations 658
4.3. Stochastic Stability Theory 660
