

CONTENTS

PREFACE	v
-------------------	---

I. THE NATURE OF PERTURBATION THEORY

1.1. Approximations in fluid mechanics	1
1.2. Rational and irrational approximations.	2
1.3. Examples of perturbation expansions	4
1.4. Regular and singular perturbation problems	6

II. SOME REGULAR PERTURBATION PROBLEMS

2.1. Introduction; basic flow past a circle	9
2.2. Circle in slight shear flow	11
2.3. Slightly distorted circle	13
2.4. Circle in slightly compressible flow	15
2.5. Effect of slight viscosity	16
2.6. Boundary layer by coordinate expansion	17
Exercises	19

III. THE TECHNIQUES OF PERTURBATION THEORY

3.1. Introduction; limit processes	21
3.2. Gauge functions and order symbols	23
3.3. Asymptotic representations; asymptotic series	26
3.4. Asymptotic sequences	28
3.5. Convergence and accuracy of asymptotic series	30
3.6. Properties of asymptotic expansions	32
3.7. Successive approximations	34
3.8. Transfer of boundary conditions	36
3.9. Direct coordinate expansions	37
3.10. Inverse coordinate expansions	41
3.11. Change of type and of characteristics	42
Exercises	43

IV. SOME SINGULAR PERTURBATION PROBLEMS IN AIRFOIL THEORY

4.1. Introduction	45
4.2. Formal thin-airfoil expansion	46
4.3. Solution of the thin-airfoil problem	48
4.4. Nonuniformity for elliptic airfoil	50
4.5. Nonuniqueness; eigensolutions	52
4.6. Joukowski airfoil; leading-edge drag	54
4.7. Biconvex airfoil; rectangular airfoil	56
4.8. A multiplicative correction for round edges	59
4.9. Local solution near a round edge	62
4.10. Matching with solution near round edge	64
4.11. Matching with solution near sharp edge	68
4.12. A shifting correction for round edges	71
Exercises	73

V. THE METHOD OF MATCHED ASYMPTOTIC EXPANSIONS

5.1. Historical introduction	77
5.2. Nonuniformity of straightforward expansion	78
5.3. A physical criterion for uniformity	80
5.4. The role of composite and inner expansions	83
5.5. Choice of inner variables	85
5.6. The role of matching	88
5.7. Matching principles	89
5.8. Intermediate matching	91
5.9. Matching order	93
5.10. Construction of composite expansions	94
Exercises	97

VI. THE METHOD OF STRAINED COORDINATES

6.1. Historical introduction	99
6.2. A model ordinary differential equation	101
6.3. Comparison with method of matched expansions	104
6.4. Nonuniformity in supersonic airfoil theory	106
6.5. First approximation by strained coordinates	109
6.6. Modifications for corners and shock waves	112
6.7. First approximation by matched expansions	116

6.8. Utility of the method of strained coordinates	118
Exercises	119

VII. VISCOUS FLOW AT HIGH REYNOLDS NUMBER

7.1. Introduction	121
7.2. Alternative interpretations of flat-plate solution	122
7.3. Outer expansion for flat plate; basic inviscid flow	124
7.4. Inner expansion; boundary-layer equations; matching	126
7.5. Boundary-layer solution for flat plate	129
7.6. Uniqueness of the Blasius solution	131
7.7. Flow due to displacement thickness	132
7.8. Second-order boundary layer for semi-infinite plate	134
7.9. Second-order boundary layer for finite plate	136
7.10. Local and integrated skin friction	137
7.11. Third approximation for semi-infinite plate	139
7.12. The effect of changing boundary-layer coordinates	140
7.13. Alternative coordinates for flat plate	142
7.14. Determination of optimal coordinates	144
7.15. Extension of the idea of optimal coordinates	145
Exercises	146

VIII. VISCOUS FLOW AT LOW REYNOLDS NUMBER

8.1. Introduction	149
8.2. Stokes' solution for sphere and circle	151
8.3. The paradoxes of Stokes and Whitehead	152
8.4. The Oseen approximation	153
8.5. Second approximation far from sphere	156
8.6. Second approximation near sphere	159
8.7. Higher approximations for circle	161
Exercises	165

IX. SOME INVISCID SINGULAR PERTURBATION PROBLEMS

9.1. Introduction	167
9.2. Lifting wing of high aspect ratio	167
9.3. Lifting-line theory by matched asymptotic expansions	170
9.4. Summary of third approximation	173
9.5. Application to elliptic wing	174

9.6. Slightly supersonic flow past a slender circular cone	176
9.7. Second approximation and shock position	178
9.8. Third approximation for pressure on cone	180
9.9. Hypersonic flow past thin blunted wedge	182
9.10. Small-disturbance solution for blunted wedge	185
9.11. Middle expansion for entropy layer	186
9.12. Inner expansion for entropy layer	187
9.13. Composite expansions for blunted wedge	190
Exercises	192

X. OTHER ASPECTS OF PERTURBATION THEORY

10.1. Introduction	195
10.2. The method of composite equations	195
10.3. The method of composite expansions	197
10.4. The method of multiple scales	198
10.5. The prevalence of logarithms	200
10.6. Improvement of series; natural coordinates.	202
10.7. Rational fractions	205
10.8. The Euler transformation	207
10.9. Joining of coordinate expansions	210
10.10. Joining of different parameter expansions	212
Exercises	213
REFERENCES AND AUTHOR INDEX	215
SUBJECT INDEX	223
