Preface	v
Chapter 1. The Historical Development of Modern Physics, from 1900 to Bohr's Theory	1
1-1. Introduction	1
1-2. The Electron and the Nuclear Atom	3
1-3. The Development of the Quantum Theory from 1901 to 1913.	12
1-4. The State of Atomic Spectroscopy in 1913	17
1-5. The Postulates of Bohr's Theory of Atomic Structure	19
1-6. The Quantum Conditions, and Bohr's Theory of Hydrogen	22
1-7. Elliptic Orbits, Space Quantization, and Zeeman Effect in Hydrogen.	26
1-8. Sommerfeld's Quantum Condition for the Linear Oscillator.	27
Chapter 2. Modern Physics from Bohr's Theory to Wave Mechanics	31
2-1. Introduction	31
2-2. Waves and Photons in Optics	32
2-3. The Wave Hypothesis of de Broglie	35
2-4. Newtonian Mechanics as a Limit of de Broglie's Wave Hypothesis	37
2-5. Wave Packets and the Uncertainty Principle	40
2-6. Schrödinger's Equation	44
2-7. Suggested References on Atomic Physics and Quantum Mechanics	47
Chapter 3. Schrödinger's Equation and Its Solutions in One-dimensional Problems.	51
3-1. Hamiltonian Mechanics and Wave Mechanics	51
3-2. Schrödinger's Equation, and the Existence of Stationary States	54
3-3. Motion of a Particle in a Region of Constant Potential	58
3-4. Joining Conditions at a Discontinuity of Potential	61
3-5. Wave Functions in a Potential Well, and Other Related Problems	65
3-6. The WKB Solution and the Quantum Condition	74
3-7. The Linear Oscillator	79
3-8. The Numerical Solution of Schrödinger's Equation	83
Chapter 4. Average Values and Matrices	86
4-1. Introduction	86
4-2. The Orthogonality of Eigenfunctions, and the General Solution of Schrödinger's Equation	86
4-3. The Average Values of Various Quantities	92

4-4. Matrix Components	95
4-5. Some Theorems Regarding Matrices	98
4-6. Matrix Components for the Linear Oscillator	102
4-7. Average Values and the Motion of Wave Packets	104
4-8. The Equation of Continuity for the Probability Density	105
Chapter 5. The Variation and Perturbation Methods.	110
5-1. The Variation Principle	110
5-2. The Expansion of the Wave Function in Orthogonal Functions	113
5-3. The Secular Problem with Two Eigenfunctions	119
5-4. The Perturbation Method in the General Case	123
5-5. Properties of Unitary Transformations	126
Chapter 6. The Interaction of Radiation and Matter	131
6-1. The Quantization of the Electromagnetic Field	131
6-2. Quantum Statistics and the Average Energy of an Oscillator	133
6-3. The Distribution of Modes in the Cavity	135
6-4. Einstein's Probabilities and the Equilibrium of Radiation and Matter	137
6-5. Quantum Theory of the Interaction of Radiation and Matter	140
6-6. The Classical Limit for Electromagnetic Problems	142
6-7. Hamiltonian and Wave-mechanical Treatment of an Atomic System in a Classical Radiation Field	144
6-8. The Method of Variation of Constants for Transition Probabilities	148
6-9. The Kramers-Heisenberg Dispersion Formula	154
6-10. Dirac's Theory of the Interaction of Radiation and Matter	158
6-11. The Breadth of Spectrum Lines	159
Chapter 7. The Hydrogen Atom.	166
7-1. Schrödinger's Equation for Hydrogen	166
7-2. The Radial Wave Function for Hydrogen	170
7-3. The Angular Momentum; Dependence of the Wave Function on Angles	177
7-4. Series and Selection Rules	182
Chapter 8. The Central-field Model for Atomic Structure	188
8-1. Introduction	188
8-2. The Postulates of the Central-field Method	189
8-3. The Periodic Table of the Elements	192
8-4. Spectroscopic Evidence for the Central-field Model	196
8-5. An Example of Atomic Spectra: the Sodium Atom	199
8-6. Optical and X-ray Energy Levels of the Atoms	205
8-7. Dimensions of Electronic Wave Functions in Atoms	209
Chapter 9. The Self-consistent-field Method	213
9-1. Hartree's Assumption for the Atomic Wave Function	213
9-2. The Average Hamiltonian for an Atom	215
9-3. Energy Integrals for the Hartree Calculation	216
9-4. The Hartree Equations as Determined by the Variation Method	219
9-5. Examples of Calculation by the Self-consistent-field Method	222
9-6. The One-electron and Many-electron Energies of an Atom	226
9-7. Inner and Outer Shielding	227
9-8. Interpretation of the Rydberg Formula	229

Chapter 10. The Vector Model of the Atom	234
10-1. Multiplets in Complex Spectra	234
10-2. The Russell-Saunders Coupling Scheme	239
10-3. The Classical Mechanics of Vector Coupling	245
10-4. Landé's Theory of Multiplet Separation and the Zeeman Effect	249
10-5. General Survey of Wave-mechanical Theory of Multiplet Structure	252
Chapter 11. The Behavior of Angular-momentum Vectors in Wave Mechanics	255
11-1. The Angular Momentum of an Electron in a Central Field	255
11-2. The Precession of the Angular-momentum Vector	258
11-3. General Derivation of Matrix Components of Angular Momentum	259
11-4. Application of Angular-momentum Properties to Complex Atoms	264
11-5. The Nature of Spin-orbitals	271
11-6. Use of Angular-momentum Operators in Cases Including Spins	274
Chapter 12. Antisymmetry of Wave Functions and the Determinantal Method	279
12-1. Wave Functions and Matrix Components of the Hamiltonian for the Two-electron System	279
12-2. Symmetric and Antisymmetric Wave Functions, and Pauli's Exclusion Principle	282
12-3. Spin Coupling in the Two-electron System	286
12-4. The Antisymmetric Wave Function in the N -electron Case	288
12-5. Matrix Components of Operators with Respect to Determinantal Wave Functions	291
Chapter 13. The Elementary Theory of Multiplets	296
13-1. The Secular Problem in Russell-Saunders Coupling	296
13-2. Further Examples of the Secular Problem	301
13-3. Matrix Components of the Hamiltonian for the Central-field Problem	306
13-4. Energy Values for Simple Multiplets	312
Chapter 14. Further Results of Multiplet Theory: Closed Shells and Average Energies	316
14-1. Closed and Almost Closed Shells	316
14-2. The Average Energy of a Configuration	322
14-3. Formulation of Multiplet Calculations in Terms of Average Energy	326
Chapter 15. Multiplet Calculations for Light Atoms	332
15-1. Introduction	332
15-2. Experimental Energy Levels of Light Elements	337
15-3. Determination of E_{av} , $F^2(2p,2p)$, and $G^1(2s,2p)$ from Experiment, Using Least Squares	343
15-4. Simple Analytic Models for Wave Functions and Energies of Light Atoms	348
15-5. The Self-consistent-field Method for Light Atoms	356
15-6. Ionization Potentials and X-ray Energy Levels	364
15-7. Simplified Treatment of Light Atoms	368
Chapter 16. Multiplet Calculations for Iron-group Elements	374
16-1. Introduction	374
16-2. Experimental Results on Iron-group Multiplets	376
16-3. Self-consistent-field Calculations for the Iron Group: Multiplet Separations	383

16-4. Comparison of Theory and Experiment for Total Energy and Ionization Potentials	389
Appendix	
1. Bohr's Theory for Motion in a Central Field	395
2. The Principle of Least Action	402
3. Wave Packets and Their Motion	405
4. Lagrangian and Hamiltonian Methods in Classical Mechanics	412
5. The WKB Method	420
6. Properties of the Solution of the Linear-oscillator Problem	422
7. The Hermitian Character of Matrices	426
8. Solution of a Cubic Secular Equation	429
9. Orthogonality of Solutions of a Secular Problem	430
10. The Correspondence Principle	432
11. The Sum Rule for Oscillator Strengths.	441
12. The Quantum Theory of the Electromagnetic Field	443
13. Schrödinger's Equation for the Central-field Problem	455
14. Properties of the Associated Legendre Functions	457
15. Solutions of the Hydrogen Radial Equation	461
16. Bibliography of the Hartree and Hartree-Fock Methods.	468
17. The Thomas-Fermi Method for Atoms.	480
18. Commutation Properties of Angular Momenta for Atoms	484
19. Positive Nature of Exchange Integrals.	486
20a. Tabulation of c 's and a 's for Multiplet Theory for s , p , and d Electrons	488
21a. Tabulation of Energies of Multiplets	491
Index	495
