PREFACE TO THE ENGLISH EDITION	xv
NOTE	xvii

PART I

Elementary Information on Atomic Spectra

CHAPTER 1 THE HYDROGEN SPECTRUM	3
§ 1. Schrödinger's equation for the hydrogen atom	3
1. Energy levels	3
2. Wave functions	6
§ 2. Series regularities	9
1. Radiative transition selection rules	9
2. Series regularities	10
3. Hydrogen-like ions	12
§ 3. Fine structure	13
1. Velocity-dependence of electron mass	13
2. Correction due to electron spin	14
3. Fine structure	16
4. Lamb shift	19
CHAPTER 2 SYSTEMATICS OF THE SPECTRA OF MULTI-ELECTRON ATOMS	21
§ 4. Central field	21
1. Central field approximation	21
2. Parity of states	23
3. Systematics of electron states in a central field	24
§ 5. General picture of electrostatic and spin-orbit splitting of levels in the <i>LS</i> -coupling approximation	25
1. Spectral terms, <i>L</i> , <i>S</i> quantum numbers	25
2. Fine structure of terms	25
3. Finding the terms of multi-electron configurations	27
4. Radiative transitions	29
§ 6. <i>jj</i> -coupling approximation	29
1. Various coupling types	29
2. Systematics of electron states with <i>jj</i> -coupling	31
CHAPTER 3 SPECTRA OF MULTI-ELECTRON ATOMS	36
§ 7. Periodic system of elements	36
§ 8. Spectra of the alkali elements	38

1. Term scheme of the alkali elements	38
2. Series regularities	40
3. Fine structure of alkali spectra	41
4. General characteristics of alkali spectra	44
5. Copper, silver and gold spectra	44
§ 9. Spectra of the alkaline-earth elements	45
1. He spectrum	45
2. Spectra of the alkaline-earth elements	46
3. Zinc, cadmium and mercury spectra	48
§ 10. Spectra of elements with p -valence electrons	48
1. One p -electron outside filled shells	48
2. Configuration p^2	50
3. Configuration p^3	51
4. Configuration p^4	52
5. Configuration p^5	52
6. Configuration p^6	53
§ 11. Spectra of elements with unfilled d - and f -shells	54
1. Elements with unfilled d -shells	54
2. Elements with unfilled f -shells	55

PART II

Theory of Atomic Spectra

CHAPTER 4 ANGULAR MOMENTA	61
§ 12. Angular momentum operator. Addition of angular momenta	61
1. Orbital angular momentum	61
2. General definition of the angular momentum operator	63
3. Electron spin	64
4. Addition of two angular momenta	65
5. Addition of three and more angular momenta	67
6. Vector model	69
§ 13. Angular momentum vector addition coefficients	71
1. Clebsch-Gordan coefficients and associated coefficients	71
2. Summary of formulae for $3j$ -symbols	73
3. Racah W -coefficients and $6j$ -symbols	76
4. Summary of formulae for $6j$ -symbols	79
5. $9j$ -symbols	80
§ 14. Irreducible tensor operators	83
1. Spherical tensors	83
2. Matrix elements	85
3. A number of examples for calculation of reduced matrix elements	86
4. Tensor product of operators	87
5. Matrix elements with coupled angular momenta	91
6. Direct product of operators	92
CHAPTER 5 SYSTEMATICS OF THE LEVELS OF MULTI-ELECTRON ATOMS	95
§ 15. Wave functions	95
1. Central field approximation	95
2. Two-electron wave functions in LSM_LM_S representation	96
3. Two-electron wave functions in $mm'SM_S$ representation	98
4. Multi-electron wave functions in a parentage scheme approximation	99
5. Fractional parentage coefficients	100
6. Classification of identical terms of l^n configuration according to seniority (seniority number)	103

§ 16. Matrix elements of symmetric operators	112
1. Statement of the problem	112
2. <i>F</i> -Matrix elements. Parentage scheme approximation	113
3. <i>F</i> -Matrix elements. Equivalent electrons	115
4. <i>Q</i> -Matrix elements. Parentage scheme approximation.	116
5. <i>Q</i> -Matrix elements. Equivalent electrons	118
6. Summary of results	119
§ 17. Electrostatic interaction in <i>LS</i> -coupling. Two-electron configurations	119
1. Self-consistent field	119
2. Slater's method (Diagonal sum method)	121
3. Coulomb and exchange integrals	122
4. Examples	125
5. Direct calculation of matrix elements	127
6. Electrostatic interaction operator	129
7. Configuration mixing	131
§ 18. Electrostatic interaction in <i>LS</i> -coupling. Multi-electron configurations	133
1. Configuration l^n	133
2. Configuration $l^n l'$	137
3. Shells more than half-filled	141
4. Filled shells	142
5. Two-configuration matrix elements	143
6. Applicability of a single-configuration approximation	145
7. Perturbation of series	148
§ 19. Multiplet splitting in <i>LS</i> -coupling	163
1. Preliminary remarks	163
2. Landé interval rule	164
3. One electron outside closed shells	165
4. Configuration l^n	166
5. Parentage scheme approximation	168
6. Fine structure splitting of levels of He	169
7. Spin-spin and spin-other orbit interactions	174
§ 20. <i>jj</i> -coupling and other types of coupling	175
1. <i>jj</i> -coupling. Wave functions	175
2. <i>jj</i> -coupling. Spin-orbit and electrostatic interaction	177
3. Transformations between <i>LS</i> - and <i>jj</i> -coupling schemes	179
4. Intermediate coupling	180
5. <i>jl</i> -coupling	185
6. Experimental data	186
7. Other types of coupling	193
§ 21. Hartree-Fock self-consistent field method	193
1. Approximate calculation of energy levels and wave functions	193
2. Fock equations in the single-configuration approximation	195
3. Examples on the derivation of the Fock equations	200
4. Hartree equations	202
5. Multiconfiguration approximation	202

CHAPTER 6 HYPERFINE STRUCTURE OF SPECTRAL LINES

204

§ 22. Nuclear magnetic dipole and electric quadrupole moments	204
1. Independent-particle model (shell model)	204
2. Nuclear magnetic moments	205
3. Quadrupole moments	207
§ 23. Hyperfine splitting	209
1. General character of the splitting	209
2. Calculation of the hyperfine splitting constant <i>A</i>	211
3. Calculation of the hyperfine splitting constant <i>B</i>	217
4. Radiative transitions between hyperfine structure components	218

5. Determination of the nuclear spin I and moments μ , Q from hyperfine splitting	219
6. Higher nuclear multipole moments	221
§ 24. Isotope effect	222
1. Isotope shift in atomic levels and nuclear structure	222
2. Mass effect (normal and specific)	223
3. Volume effect	228
CHAPTER 7 RELATIVISTIC CORRECTIONS	231
§ 25. Dirac equation	231
1. Dirac equation	231
2. Electron spin	233
3. Nonrelativistic approximation (Pauli theory)	235
§ 26. Central field	237
1. Nonrelativistic approximation	237
2. Second approximation with respect to v/c . Fine splitting	239
3. Dirac equation	242
4. Coulomb field. Energy levels	244
5. Coulomb field. Radial functions	247
§ 27. Relativistic corrections	250
1. Calculation of some radial integrals	250
2. Calculation of hyperfine splitting constant A	251
3. Calculation of hyperfine splitting constant B	254
4. Isotope shift of levels (Volume effect)	256
5. Correction for finite volume of the nucleus in the theory of hyperfine structure	258
PART III	
Excitation and Radiation of Atoms. Elementary Processes	
CHAPTER 8 THE ATOM IN AN EXTERNAL FIELD	263
§ 28. Electric field. Stark effect	263
1. Quadratic Stark effect	263
2. Hydrogen-like levels. Linear Stark effect	268
3. Inhomogeneous field. Quadrupole splitting	271
4. Variable field	272
5. De-excitation of the $2s$ level of the hydrogen atom in an electric field	276
§ 29. Magnetic field. Zeeman effect	277
1. Weak field	277
2. Strong field	281
3. Splitting of hyperfine structure components in a magnetic field	285
CHAPTER 9 INTERACTION OF ATOMS WITH AN ELECTROMAGNETIC FIELD	286
§ 30. Radiation of electromagnetic waves	286
1. Radiation field in the wave zone	286
2. Electric dipole radiation	287
3. Quantization of the radiation field	289
4. Radiative transition probabilities and correspondence principle for spontaneous emission	291
5. Induced emission and absorption. Einstein's coefficients	294
6. Effective absorption cross-section. Absorption coefficient	297
7. Spectral line intensity. Spectrum excitation	300
8. Effective excitation cross-sections	302
§ 31. Electric dipole radiation	305
1. Selection rules, polarization and angular distribution	305
2. Transition oscillator strengths and line strengths	307

3. <i>LS</i> -Coupling approximation. Relative intensities of multiplet components	310
4. One electron outside closed shells	312
5. Parentage scheme approximation	313
6. Equivalent electrons	314
7. <i>jj</i> -Coupling	319
8. Relative intensities of Zeeman and Stark components of lines	321
§ 32. Multipole radiation	322
1. Fields of electric and magnetic multipole moments	322
2. Intensity of multipole radiation	325
3. Selection rules	327
4. Electric multipole radiation	328
5. Magnetic dipole radiation	331
6. Transitions between hyperfine structure components. Hydrogen radio emission $\lambda = 21$ cm	333
§ 33. Calculation of oscillator strengths	335
1. Approximation methods of calculating radiative transition probabilities	335
2. Three possible forms of writing formulae for transition probabilities	336
3. Theorems on oscillator strength sums	338
4. Semiempirical methods of calculating oscillator strengths	341
5. Bates-Damgaard tables	342
6. Possible methods of refining the calculations	343
7. Treatment of magnetic interactions	350
§ 34. Continuous spectrum	353
1. Classification of the processes	353
2. Photorecombination and photoionization. General expressions for effective cross-sections	354
3. Bremsstrahlung and absorption. General formulae for effective cross-sections	359
4. Radiation and absorption coefficients	361
5. Photorecombination and photoionization. Hydrogen-like atoms	364
6. Photorecombination and photoionization. Non-hydrogenlike atoms	369
7. Bremsstrahlung and absorption in a Coulomb field	372
 CHAPTER 10 BROADENING OF SPECTRAL LINES	 377
§ 35. Radiative and Doppler broadening	377
1. Radiative broadening of spectral lines	377
2. Doppler broadening	379
3. Combined action of radiation damping and Doppler effect	380
§ 36. General theory of the effects of pressure in a binary approximation	383
1. Model of an oscillator with variable frequency	383
2. Impact theory	386
3. Statistical theory	391
4. Relationship and limits of applicability of the impact and statistical theories	392
5. Discussion of the limits of applicability and the possibilities of refinement of the model	396
6. Combined treatment of radiation damping, Doppler effect and pressure effects	398
§ 37. Quantum mechanical generalization of the theory	402
1. Fourier analysis method	402
2. Impact theory of broadening, taking account of level degeneracy and time dependence of the perturbation	405
3. Quantum mechanical theory of spectral line broadening by electrons	410
§ 38. Broadening of lines of the hydrogen spectrum in a plasma	417
1. Ion broadening. Holtsmark theory	417
2. Correction for thermal motion and ion interaction	420
3. Electron broadening	423
4. Estimates of the contribution of electrons to broadening	428
5. Combined effect of electrons and ions	430
6. Results of numerical calculations	432
§ 39. Line broadening of nonhydrogen-like spectra in a plasma	447
1. Preliminary estimates	447
2. Electron broadening	450

3. Combined effect of electrons and ions	457
4. Treatment of field inhomogeneity	460
§ 40. Broadening by uncharged particles	460
1. Perturbation by foreign gas atoms (van der Waals interaction)	460
2. Broadening in a homogeneous gas (intrinsic pressure)	463
 CHAPTER 11 EXCITATION OF ATOMS	 466
§ 41. Fundamentals of scattering theory	466
1. Elastic scattering in a central field	466
2. Wave functions ψ_k^+ , ψ_k^-	469
3. Quasi-classical approximation	471
4. Inelastic scattering	474
5. Expression of effective cross-sections in terms of S -matrix elements	476
§ 42. Born approximation	477
1. Collisions between fast electrons and atoms. Multipole expansion	477
2. Bethe formula	481
3. Brief description of Born cross-sections. Approximation by analytic formulas	482
4. Transitions to continuum states. Ionisation of atoms and triple recombination	486
5. Second Born approximation	490
§ 43. General equations of the theory of electron collisions with atoms	492
1. Introduction	492
2. General formulae for cross-sections	493
3. Radial equations	499
4. Integral radial equations	503
5. Introduction of polarization potential	504
6. Distorted wave method	506
7. Treatment of exchange	506
8. Two state approximation and allowance for strong coupling	506
9. Polarization effect	507
10. Short discussion of the results of calculating cross-sections for excitation of atoms	508
§ 44. Some refinements and a discussion of the range of applicability of the Born method	513
1. Introductory remarks	513
2. Normalization and strong coupling	514
3. Treatment of exchange	517
4. Transitions via virtual levels	520
5. Ion excitation	520
6. The limits of applicability of the Born approximation in the case of transitions between excited states	523
§ 45. Refinement of the Born method on the basis of the free electron scattering model	526
1. Free electron scattering model	526
2. Introduction of effective charge and treatment of exchange	529
3. Discussion of the results	530
§ 46. Excitation by heavy particles	532
1. Parametric method	532
2. Two-state approximation	534
3. Transitions caused by an off-diagonal potential	538
§ 47. Spectroscopic problems associated with the theory of elastic scattering of electrons	545
1. Continuum absorption in the field of a neutral atom	545
2. Spectroscopic method of investigating elastic scattering of slow electrons (Fermi method)	548
§ 48. Tables of effective cross-sections for excitation of atoms	557
1. Method of calculation and description of the tables	557
2. Rules for the addition of cross-sections	560
3. LS -coupling; Q_x factors for transitions without change of spin ($\Delta S = 0$)	561
4. LS -coupling; Q_x factors for intercombination transitions ($\Delta S = 1$)	562
5. jl -coupling	563
Abbreviated Notations of Cited Literature	603
Subject Index	605
