
CONTENTS

1. Low-Energy Electron Collisions with Complex Atoms and Ions

P. G. Burke and W. Eissner

1. Introduction	1
2. Theory of Electron Collisions with Atoms and Ions	4
2.1. Expansion of the Collision Wave Function	4
2.2. Expansion of the Target Wave Function	6
2.3. Variational Principles and the Derivation of the Coupled Integro-Differential Equations	8
2.4. Derivation of the Cross Section	13
2.5. Inclusion of Relativistic Effects	15
2.5.1. Use of the Breit–Pauli Hamiltonian	16
2.5.2. Use of the Dirac Hamiltonian	20
3. Numerical Solution of the Coupled Integro-Differential Equations	22
3.1. Early Work	22
3.1.1. Iterative Methods	23
3.1.2. Reduction to a System of Coupled Differential Equations	24
3.2. Reduction to a System of Linear Algebraic Equations	25
3.3. <i>R</i> -Matrix Method	28
3.4. Matrix Variational Method	32
3.5. Noniterative Integral Equations Method	34
3.6. New Directions	37
3.7. Illustrative Results	40
4. Computer Program Packages	43
4.1. Structure Packages	46
4.2. Collision Packages	47
<i>References</i>	49

2. Numerical Methods for Asymptotic Solutions of Scattering Equations

D. W. Norcross

1. Introduction	55
2. Specification of Asymptotic Forms	57
3. Travels in <i>Intermedia</i>	59
3.1. Numerical Integration of the Differential Equations	60
3.2. Noniterative Integration of the Phase-Amplitude Equations	62

4.	At the Border of <i>Asymptopia</i>	66
4.1.	Asymptotic Expansions	66
4.2.	Iterative Techniques	68
4.2.1.	The Iterated WBK (IWBK) Method	69
4.2.2.	The Generalized Matricant	70
5.	Concluding Remarks	71
	<i>References</i>	72
3.	Collisions between Charged Particles and Highly Excited Atoms	
	<i>Ian Percival</i>	
1.	Introduction	75
2.	The Impact Parameter (IP) Method	77
3.	The Sudden Approximation	81
4.	Transitions between Levels with Quantum Defects	84
5.	Transitions within the Degenerate Sea	92
	<i>References</i>	101
4.	Proton Impact Excitation of Positive Ions	
	<i>A. Dalgarno</i>	
1.	Introduction	103
2.	Excitation of Fine-Structure Transitions	104
2.1.	Semiclassical Theory	106
2.2.	Quantal Theory	108
3.	Excitation of Metastable Transitions	110
4.	Charge-Transfer Ionization	111
	<i>References</i>	112
5.	Long-Range Interactions in Atoms and Diatomic Molecules	
	<i>G. Peach</i>	
1.	Introduction	115
2.	General Form of the Model Hamiltonian	118
3.	Form of the Model Potential for Atomic Systems	123
3.1.	The Exact Interaction between the Valence Electrons and the Core	123
3.2.	Second-Order Perturbation Theory: The Static Contribution	123
3.3.	The First Nonadiabatic Correction	125
3.4.	The Second Nonadiabatic Correction	129
3.5.	Nonadiabatic Corrections of Higher Order	134
3.6.	Third-Order Perturbation Theory: The Static Contributions	136
3.7.	Summary of Results	138

4.	Form of the Model Potential for Diatomic Systems	138
4.1.	The Exact Interaction between the Valence Electrons and the Cores	138
4.2.	Second-Order Perturbation Theory: The Static Contributions	141
4.3.	The First Nonadiabatic Correction	143
4.4.	The Second Nonadiabatic Correction	144
4.5.	Nonadiabatic Corrections of Higher Order	154
4.6.	Third-Order Perturbation Theory: The Static Contribution	156
4.7.	Summary of Results and the Separated Atom Limit	161
5.	Addition Theorems for Solid Harmonics	166
	<i>References</i>	170

6. Applications of Quantum Defect Theory

David L. Moores and Hannelore E. Saraph

	Introduction	173
1.	Historical Survey	173
2.	Mathematical Background to Quantum Defect Theory	179
2.1.	Properties of Coulomb Wave Functions	179
2.2.	Solutions of the Coupled Equations	182
2.2.1.	All Channels Closed	185
2.2.2.	Some Channels Open	186
3.	Single-Channel Quantum Defect Methods: General Formulas in the Independent-Particle Approximation	188
3.1.	Expressions for the Wave Functions	188
3.2.	General Formulas for Radiative Transition Probabilities	190
3.3.	Collision Cross Sections	192
3.3.1.	Use of Extrapolated Quantum Defects	192
3.3.2.	Use of Adjusted Calculated Quantum Defects	192
3.3.3.	Use of Observed Quantum Defects in the Bethe Approximation	192
3.4.	Summary	192
4.	Applications to Simple Multichannel Problems	193
4.1.	The Spectrum of Calcium	193
4.1.1.	Bound States	194
4.1.2.	Autoionizing States	196
4.2.	Bound States of Complex Ions by Extrapolation of Calculated Scattering Parameters: Configurations $1s^22s^22p^4nl$	200
4.3.	The Spectrum of the H_2 Molecule	202
5.	Extrapolation of the Generalized Reactance Matrix	207
5.1.	Discussion of Extrapolation Methods	208
5.1.1.	Restrictions on the Validity of Extrapolation Methods	208
5.1.2.	Fitting Techniques	210
5.2.	Applications	211
5.2.1.	Collision Strengths in LS -Coupling	211

5.2.2.	Collision Strengths for Excitations between Fine-Structure Levels	212
5.2.3.	Photoionization Cross Sections	212
5.2.4.	Electron Impact Ionization Cross Sections	215
6.	Conclusions	216
	<i>References</i>	217
7.	Electron–Ion Processes in Hot Plasmas	
	<i>Jacques Dubau and Henri van Regemorter</i>	
1.	Introduction	221
2.	Line Intensities	223
2.1.	Level Populations	223
2.2.	Forbidden Lines	225
2.3.	Satellite Lines	228
3.	Electron–Ion Processes	230
3.1.	Introduction	230
3.2.	The $A^{+z} + e$ System	235
3.3.	Coupling between Open Channels	240
3.4.	Resonance Contribution to Collisional Excitation	244
3.5.	Approximate Methods for Strong Allowed Transitions	248
3.6.	Relativistic Effects	251
3.7.	Relativistic Effects in Autoionization	254
4.	Conclusion	255
	Appendix	256
A.1.	Derivation of $a_m(E)$ and $b'_l(E)$	256
A.2.	Resonances	258
A.3.	Gailitis Formula	261
	<i>References</i>	262
8.	The University College Computer Package for the Calculation of Atomic Data: Aspects of Development and Application	
	<i>H. Nussbaumer and P. J. Storey</i>	
1.	Introduction	265
2.	The Growth of Astronomical Observations	266
3.	Some Aspects of the Genesis of the Programs	268
4.	The C III Challenge	273
4.1.	Collision Strengths and Transition Probabilities for the Interpretation of the Solar Spectrum	273
4.2.	Excitation of C III by Recombination	275
4.2.1.	Observations	275
4.2.2.	Rate Coefficients from Detailed Balance Arguments	276
4.2.3.	Improved Low-Temperature Coefficients	278
	<i>References</i>	285

9. Planetary Nebulae

D. R. Flower

1. Introduction	289
2. Observations	289
2.1. Optical	289
2.2. Infrared	293
2.3. Radio	296
2.4. Ultraviolet	300
2.4.1. NGC 7662	304
2.4.2. IC 418	307
2.4.3. The C/O Ratio in Planetary Nebulae	309
3. Models: Atomic Data	310
3.1. Charge Transfer	310
3.1.1. O^+	310
3.1.2. O^{2+}	312
3.1.3. Ne^{2+}	312
3.2. Dielectronic Recombination	312
3.3. Photoionization and Radiative Recombination	313
3.4. Electron Collisional Excitation	317
3.5. Radiative Transition Probabilities	319
<i>References</i>	320

10. Forbidden Atomic Lines in Auroral Spectra

D. R. Bates

1. Introduction	325
2. Beginnings	325
3. Seaton's Work	327
4. Refinement of Classical Theory	330
5. Advent of <i>In Situ</i> Measurements	333
6. $N_2(A^3\Sigma_u^+)$ -O Excitation Transfer	334
7. Quenching	335
8. Coordinated Rocket and Satellite Measurements	337
9. $\lambda 3466$ and $\lambda 10,400$ of N I	342
<i>References</i>	343
