Preface	ix
1 The Self-consistent Field Model	1
1.1 Self-consistent fields	2
1.2 Open-shell electronic states	5
1.3 The unrestricted Hartree–Fock method	6
1.4 Choice of basis set	7
1.5 ‘Atomic units’	10
1.6 Literature of <i>ab initio</i> calculations	11
1.7 Calculations	12
Suggestions for background reading	12
References	12
2 Electron Correlation	13
2.1 Introduction	13
2.2 Generalised valence bond	14
2.3 Configuration interaction	15
2.4 Multiconfiguration SCF (MCSCF)	19
2.5 The size consistency problem	20
References	20
3 Energies	21
3.1 Ionisation energy	21
3.2 The Δ SCF method	27
3.3 Effect of electron correlation	28
3.4 The scattered wave X- α method	28
3.5 The Auger effect	30
3.6 Barriers to internal rotation	32
3.7 Potential energy surfaces	35
3.8 Calculations of potential energy surfaces	36
3.9 Ghost orbitals	40
3.10 Calculations involving electron correlation	41
3.11 Semi-empirical potential surfaces	41
References	43

4 Geometries and Force Fields	45
4.1 Small molecules	46
4.2 Open-shell molecules	49
4.3 Gradient techniques	50
4.4 Hellmann–Feynman theorem	53
4.5 Evaluation of gradients	55
4.6 Force constants	56
4.7 Hydrogen bonded species	57
4.8 Van der Waals molecules	63
4.9 Molecular mechanics	65
References	66
5 Electric Multipole Moments	68
5.1 Basic electrostatics	68
5.2 Multipole moments	70
5.3 The electrostatic potential	72
5.4 The multipole expansion	73
5.5 Determination of electric dipole moment	74
5.6 The Stark effect	75
5.7 Dielectric polarisation	77
5.8 Determination of electric quadrupole moment	78
5.9 The Kerr effect	78
5.10 Microwave Zeeman determination of quadrupole moment	81
5.11 Sources of experimental data	81
5.12 Calculations of electric dipole moment	82
5.13 Effect of basis set on dipole moment	84
5.14 The effect of electron correlation	89
5.15 Calculation of electric quadrupole	90
5.16 The constrained variational method (cvm)	95
5.17 Bond moments	96
References	98
6 Other One-electron Properties	100
6.1 Introduction	100
6.2 Electric field gradients	102
6.3 Experimental determination of eQq	103
6.4 Calculation of quadrupole coupling constant	105
6.5 The Townes and Dailey theory of eQq	108
6.6 The electric field	109
6.7 Electrostatic potential	110
6.8 Higher electric moments	110
References	111

7 Electric Dipole Polarisabilities	112
7.1 Introduction	112
7.2 Determination of polarisability	113
7.3 The Stark effect	114
7.4 Molecular beam measurements	114
7.5 Refractive index	114
7.6 Relative permittivity	115
7.7 The Kerr effect	115
7.8 Experimental determination of higher polarisabilities	116
7.9 Literature sources	116
7.10 Calculations of dipole polarisability	116
7.11 scf calculations for small molecules	118
7.12 Larger molecules at the scf level	122
7.13 The effect of electron correlation	123
7.14 The polarisability of interacting systems	125
7.15 Group additivity schemes	127
References	128
8 Other Response Functions	129
8.1 Magnetisability and susceptibility	129
8.2 Measurement of susceptibility	132
8.3 Relationships between molecular properties	135
8.4 Calculation of molecular susceptibility	136
8.5 Magnetic shielding	141
8.6 Higher electric polarisabilities	142
8.7 Calculation of hyperpolarisability	143
References	144
9 Spin Properties	146
9.1 Dirac theory of the electron	146
9.2 Many particles	148
9.3 Spin Hamiltonians	149
9.4 Electron–nuclear spin hyperfine coupling	150
9.5 The cusp condition	154
9.6 Typical molecular calculations	154
9.7 Zero-field splittings	156
9.8 Nuclear spin–spin coupling	157
9.9 Finite perturbation theory	159
References	159
Index	161
