

CONTENTS

Chapter 1. INTRODUCTION TO ELECTRON-MOLECULE COLLISIONS

Kazuo Takayanagi

1. Introduction	1
2. Cross Sections	3
2.1. Concept of Cross Sections	3
2.2. Experimental Arrangements	7
2.3. Theoretical Studies of Electron-Molecule Collisions	8
2.4. Examples of the Electron-Molecule Collision Cross Sections	9
3. Electron-Molecule Interactions	16
3.1. Long-Range Interactions	17
3.2. Short-Range Interactions	22
4. Resonance Effect	25
5. Calculation of the Total Cross Section as a Potential Scattering Problem	27
5.1. Summary of the Theory for Scattering from a Central Field	27
5.2. Independent-Atom Model	32
5.3. One-Center Expansion of Nonspherical Potential	34
5.4. Separable Potentials	37
5.5. Polyatomic Molecules	40
6. Theoretical Formulation of Inelastic Scattering Processes	41
6.1. Outline of the General Theory	41
6.2. Born Approximation	44
6.3. Some Consequences of the Born Approximation. I: Elastic Collisions and Rotational Transitions	45
6.4. Some Consequences of the Born Approximation. II: Vibrational Transitions	52
6.5. Some Consequences of the Born Approximation. III: Electronic Transitions	56
6.6. Electron Exchange	68
6.7. Distorted-Wave Approximations	73
6.8. Adiabatic Approximations	74
References and Notes	80

Chapter 2. ROTATIONAL EXCITATION OF MOLECULES BY SLOW ELECTRONS

Isao Shimamura

1. Introduction	89
---------------------------	----

2.	Classical Sudden Collisions and Angular-Momentum Transfer	90
2.1.	Linear Rotators	90
2.2.	Nonlinear Rotators	95
3.	Quantum-Mechanical Sudden Collisions and Angular-Momentum Transfer	101
3.1.	Elementary Theory of Angular Momentum	101
3.2.	Sudden Approximation	107
3.3.	General Relations for the Cross Sections	114
4.	Division of the Configuration Space	127
4.1.	Dynamics in Different Regions	127
4.2.	Frame Transformation	130
4.3.	R-Matrix Theory	138
5.	Physics in the Potential Scattering Region	146
5.1.	General Trend of the Cross Sections	146
5.2.	Single-Center Expansion of the Interaction Potential	149
5.3.	Charge-Dipole Interaction	152
5.4.	Charge-Quadrupole Interaction	165
5.5.	Interaction of Shorter Range	167
6.	Physics in the Compound-System Region	168
6.1.	Multicenter Electrostatic Field	168
6.2.	Indistinguishability of All Electrons	169
6.3.	Representation in Terms of Adiabatic Angular Basis Set	171
Appendix:	Summary of Formulas	180
	References and Notes	182

Chapter 3. VIBRATIONAL EXCITATION OF MOLECULES BY SLOW ELECTRONS

Arvid Herzenberg

1.	Introduction	191
2.	Virtual States and Resonances	201
2.1.	Introduction	201
2.2.	Potential Well Scattering with $l = 0$	204
2.3.	Potential Well Scattering with $l > 0$	207
2.4.	Singularities in Potential-Well Scattering	208
2.5.	Time Delay	211
2.6.	General Resonances	214
3.	Vibrational Excitation. I: Wave-Function Enhancement without Trapping	220
4.	Vibrational Excitation. II: Electron Scattering at a Shape Resonance; Impulse Limit	225
5.	Vibrational Excitation. III: Long-Lived Resonances and Nuclear Relaxation	231
5.1.	The Nuclear Wave Equation	231
5.2.	Solutions of the Nuclear Wave Equation—Qualitative Features	235

5.3. The Complex Potential Surface	238
5.4. Semiempirical Calculations	240
5.5. <i>Ab Initio</i> Calculations in the Born–Oppenheimer Approximation	242
5.6. Other Calculations	245
6. Current Developments	246
6.1. Electronic Excitation	247
6.2. High Excitation Energies	247
6.3. More Complicated Targets	248
6.4. Rotational Effects	248
Appendix A: Resonance Scattering of Electrons by a Target with Fixed Nuclei	249
Appendix B: Resonance Scattering of an Electron by a Molecule with Relaxing Nuclei	256
Appendix C: The Impulse Approximation	266
Appendix D: Wave Packets	268
References and Notes	269

Chapter 4. DISSOCIATION OF MOLECULES BY SLOW ELECTRONS

R.N. Compton and J.N. Bardsley

1. Introduction	275
2. Dissociation of Molecules into Ground Electronic State Fragments	278
3. Dissociation into Excited Fragments	285
3.1. Dissociation of Molecules into Fragments Which Emit Radiation	285
3.2. Metastable Fragments	293
3.3. High Rydberg Fragments	297
4. Dissociative Ionization	301
5. Dissociative Attachment	306
5.1. H ₂ and D ₂	306
5.2. N ₂ and NO	308
5.3. O ₂	309
5.4. F ₂ , Cl ₂ , Br ₂ , and I ₂	310
5.5. Hydrogen Halides	312
5.6. Triatomic Molecules	314
5.7. Halogenated Methanes	316
6. Dissociative Attachment to Ultracold Molecules and Molecular Clusters	317
7. Dissociative Recombination	319
7.1. Plasmas	321
7.2. Colliding Beams	321
7.3. Ion Trap	324
7.4. Theoretical Calculations and Experimental Results	326
References and Notes	334

Chapter 5. MOLECULAR SPECTROSCOPY BY ELECTRON SCATTERING*R.I. Hall and F.H. Read*

1. Introduction	351
2. Resonance Spectroscopy of Molecules	354
2.1. The Grandparent Model and Feshbach Resonances	357
2.2. Coupling Mechanisms of Feshbach Resonances. I: Electronic Coupling	362
2.3. Coupling Mechanisms of Feshbach Resonances. II: Dynamic Coupling	367
2.4. Potential Curves of Feshbach Resonances in H ₂	369
2.5. Resonance Symmetry and Differential Cross Sections	371
2.6. Resonance Symmetry and Rotational Structure	375
2.7. Core-Excited Shape Resonances. I: Valence States	378
2.8. Core-Excited Shape Resonances. II: Rydberg States	384
3. Electron Energy-Loss Spectroscopy	385
3.1. Molecular Outer-Shell Spectroscopy at High Incident Electron Energies	395
3.2. Inner-Shell Excitation	403
3.3. Electron Scattering Spectroscopy at Intermediate Energies	409
3.4. Electron Scattering Spectroscopy at Near-Threshold Energies	416
References	420

Chapter 6. EXPERIMENTAL TECHNIQUES FOR CROSS-SECTION MEASUREMENTS*Sandor Trajmar and David F. Register*

1. Introduction	427
2. Definition of Cross Sections	428
3. Measurement of Total, Integral, and Momentum-Transfer Cross Sections	430
3.1. Total Cross Sections	431
3.2. Integral Cross Sections	435
3.3. Momentum-Transfer Cross Sections	438
4. Measurement of Differential Cross Sections	441
4.1. Instrumentation	441
4.2. Relation between Cross Section and Scattering Signal Intensity in Beam-Beam Experiments	458
4.3. Normalization Procedures	461
4.4. Experimental Techniques and Procedures	471
4.5. Discussion of Experimental Uncertainties	479
5. Electron Collision Measurements at High Energies; Generation of Optical Data	482
6. Electron Scattering in Electromagnetic Fields	483
7. Closing Remarks	485
References	486

**Chapter 7. COMPUTATIONAL METHODS FOR LOW-ENERGY
ELECTRON-MOLECULE COLLISIONS***B.D. Buckley, P.G. Burke, and C.J. Noble*

1. Introduction	495
2. Derivation of the Radial Equations	496
2.1. Electronic and Rotational Degrees of Freedom	497
2.2. The Vibrational Motion	499
3. Numerical Solution of the Fixed-Nuclei Equations	500
3.1. Single-Center Expansion Methods	501
3.2. Expansion in Prolate Spheroidal Coordinates	510
3.3. Separable Exchange Potentials	511
3.4. Model Exchange Potentials	513
3.5. Polarization Potentials	516
3.6. Continuum Multiple-Scattering Method	518
3.7. L^2 Methods	520
3.8. R -Matrix Method	522
3.9. T -Matrix Method	527
4. Vibrational Excitation and Dissociative Attachment	532
4.1. Adiabatic Nuclei Approximation	533
4.2. Hybrid Theory	534
4.3. Resonance Theory	534
4.4. R -Matrix Method	539
5. Electronic Excitation	543
5.1. Excitation of H_2^+	543
5.2. Excitation of H_2	544
5.3. Excitation of N_2	545
6. Conclusions	546
References	546
Index	557
