

CONTENTS

Chapter 1

THE REORIENTATION EFFECT

Jorrit de Boer and Jörg Eichler

1. Introduction	1
2. Classical Estimates of Effects	3
2.1 External Field Gradients	4
2.2 Electronic Field Gradient	4
2.3 Muonic X Rays	4
2.4 Coulomb Excitation	5
3. Theory of Coulomb Excitation	5
3.1 Approximations	6
3.2 First-Order Perturbation Theory	6
3.3 Second-Order Perturbation Theory as a Guide to the Exact Solution	9
3.4 Symmetrization of the Excitation Process	13
4. Theory of the Reorientation Effect	14
4.1 The Amplitude for the Excitation $0^+ \rightarrow 2^+$	14
4.2 The Excitation Probability	15
4.3 The Angular Distribution of the De-excitation Gamma Rays	16
4.4 Magnetic Dipole Reorientation	19
4.5 Corrections for Multiple $E2$ Transitions	20
5. Excitation via the Giant Dipole Resonance	21
5.1 The Transition Probability	22
5.2 Interpretation as Polarization Effect	24
6. Experimental Methods	28
6.1 Bombarding Conditions	28
6.2 Measurement of Cross Sections	32
6.3 Measurement of the Gamma-Ray Angular Distribution	39
6.4 Measurement of the Excitation of the Projectile	43

7. Reorientation Experiments	44
7.1 Experimental Methods Used	44
7.2 Results	46
7.3 Discussion	48
Acknowledgments	49
Appendix I. Numerical Expressions	49
Appendix II. Tables of Orbital Integrals	51
Appendix III. Approximate Formula for the Reorientation Effect	51
References	64

Chapter 2

THE NUCLEAR SU_3 MODEL

Malcolm Harvey

1. Introduction	67
2. Basic Shell Model	69
2.1 General Theory	69
2.2 Invariance Properties	73
2.3 Approximate- and Broken-Symmetry Groups	76
2.4 Rotational Features in the $1p$ Shell	77
3. Symmetry of Oscillator Quanta — The Groups U_3 and SU_3	79
3.1 Problems	79
3.2 Formal Properties of U_3 and SU_3	79
3.3 Classification According to U_3 and SU_3	83
3.4 Simultaneous Classification According to S_A and SU_3	85
3.5 Classification According to SU_3 and R_3	89
3.6 Classification According to SU_3 and $SU_2 \times U_1$	90
3.7 Construction of States Classified According to SU_3 and R_3	94
4. The Effective Interaction	99
4.1 General Principles	99
4.2 The Quadrupole-Quadrupole Force	100
4.3 The Casimir Operator of SU_3	103
5. Application of the SU_3 -Coupling Scheme to Light Nuclei	105
5.1 General Remarks	105
5.2 Accuracy of the SU_3 Classification Scheme in the ($2s, 1d$) Shell	106
5.3 Positive-Parity States of Doubly Even Nuclei in the ($2s, 1d$) Shell	109

5.4 Positive-Parity States of Odd A and Doubly Odd Nuclei in the $(2s, 1d)$ Shell	123
5.5 Negative-Parity States in the $(2s, 1d)$ Shell	128
5.6 Multi-Excitation States in the $(2s, 1d)$ Shell	139
5.7 Multi-Excitation States in the $1p$ Shell	142
6. Summary and Developments	142
Acknowledgments	148
References	148
Appendix A. Harmonic Oscillator	152
Appendix B. Use of Groups in Quantum Mechanics	154
Appendix C. The Symmetric and Unitary Groups	157
Appendix D. Generating Operators of U_s	162
Appendix E. Classification According to SU_3 without the Harmonic Oscillator	165
Appendix F. Raising and Lowering Operators of the Group SU_3	166
Appendix G. Calculation of Matrix Elements	170
Appendix H. The Normalization Coefficients and Overlaps	177
Appendix I. Use of the Group SU_3 in the Classification of Elementary Particles	180

Chapter 3

THE HARTREE-FOCK THEORY OF DEFORMED LIGHT NUCLEI

Georges Ripka

1. Introduction	183
2. The Hartree-Fock Equations	187
3. Symmetries of the Hartree-Fock Hamiltonian	189
3.1 Time-Reversal Symmetry	190
3.2 Parity and Axial Symmetry	191
3.3 Isospin Invariance	191
3.4 Spherical Symmetry	191
3.5 Spin and Isospin Invariance	192
4. The Choice of an Expansion for the Orbita	192
4.1 Spherical Symmetry	194
4.2 Axial Symmetry	194

4.3 Ellipsoidal Symmetry	194
4.4 Time-Reversal and Mixed-Parity Solutions	195
5. Single Major Shell Hartree-Fock Calculations	196
5.1 Spherical Solutions	196
5.2 The Use of a Reference Closed-Shell Nucleus	197
5.3 The Choice of the Interaction Strength, of the Single- Particle Energies, and of the Oscillator Constant	199
6. Solutions of the Single Major-Shell Hartree-Fock Calculations for Even-Even $N = Z$ Nuclei	203
6.1 Spherical Solutions	203
6.2 Axially Symmetric Solutions	206
6.3 Ellipsoidal Solutions	206
6.4 The Energy Gap and the Spectrum of the Hartree-Fock Orbits	207
7. Deformed Excited Equilibrium States of Spherical Nuclei	210
8. A Soluble Model—The Effect of the Exchange Components of the Interaction	213
9. The Deformation of the Hartree-Fock Field—The Quadrupole- Quadrupole Interaction	216
10. The Effect of the Spin-Orbit Splitting	224
11. The Multiplicity of Hartree-Fock Solutions	227
12. Hartree-Fock Solutions of Other Nuclei	230
13. Magnetic Moments of Odd- A Nuclei	233
14. Angular Momentum Projection	235
15. Major-Shell-Mixing Hartree-Fock Calculations—Quadrupole Polarization of Closed Shells	244
16. Conclusion	256
Acknowledgments	257
References	257

Chapter 4**THE STATISTICAL THEORY OF
NUCLEAR REACTIONS****Erich Vogt**

1. Introduction	261
1.1 Early Evaporation Models	262
1.2 Refinement of the Early Evaporation Models	268

2. The Model for Average Cross Sections	270
2.1 Basic Evaporation Theory	270
2.2 Extension of the Model to Differential Cross Sections	275
2.3 Behavior of Transmission Functions	281
3. Application of the Evaporation Model	296
3.1 Inelastic Neutron Scattering at Low Energies	297
3.2 The $C^{12} + C^{12}$ Reactions	302
3.3 Evaporation Model with Level Densities	313
3.4 The Range of Recent Applications	318
4. Basis of the Evaporation Model in Reaction Theory	321
5. Conclusions	332
Acknowledgments	333
Appendix A. Absorption Cross Section of a Complex Square Well	334
Appendix B. Effect of Finite Averaging Interval	337
References	339

Chapter 5

THREE-PARTICLE SCATTERING— A REVIEW OF RECENT WORK ON THE NONRELATIVISTIC THEORY

Ian Duck

1. Introduction	343
1.1 Resumé of Two-Particle Scattering Theory	344
1.2 Difficulties in Three-Particle Scattering Theory	355
2. The Amado Model	357
2.1 Construction of the Model	357
2.2 Nucleon–Deuteron Elastic Scattering	367
2.3 Nucleon–Deuteron Inelastic Scattering	372
3. The Faddeév Equations	378
3.1 Rearrangement Scattering	378
3.2 The Faddeév Equations	382
4. Application of the Faddeév Equations	388
4.1 Hetherington–Schick Analysis of the Multiple-Scattering Series	388
4.2 Lovelace–Phillips’ Calculations of Neutron–Deuteron Scattering	390

4.3 Relativistic Faddeév Equations	391
4.4 Three-Particle Correlation Energy in Nuclear Matter	394
5. Concluding Remarks	396
Acknowledgments	397
References	397
Appendix A	400
Appendix B	401
Appendix C	405
Appendix D	406
Appendix E	409
INDEX	411
