## *Chapter 1*

### **Variational Techniques in the Nuclear Three-Body Problem**

**L. M. Delves**

1. Introduction . . . . .	1
2. Variation Principles for Bound States . . . . .	10
2.1. The Rayleigh–Ritz Principle . . . . .	11
2.2. Bound States of Three Bosons . . . . .	15
2.3. Estimates of the Accuracy of a Variational Calculation . . . . .	19
3. Numerical Techniques . . . . .	37
3.1. Choice of Trial Function . . . . .	37
3.2. The Calculation of the Normalization and Hamiltonian . . . . .	66
Integrals . . . . .	66
3.3. Solution of the Finite Matrix Equation . . . . .	80
3.4. Control and Analysis of Round-off and Integration . . . . .	85
Errors . . . . .	85
4. Bound State Calculations with Realistic Local Potentials . . . . .	100
4.1. Reduction of the Equations of Motion . . . . .	101
4.2. Construction of the Trial Function . . . . .	102
4.3. Calculations in the Harmonic Oscillator Basis . . . . .	109
4.4. Calculations Using Hard-Core Potentials . . . . .	110
5. Variational Methods for Scattering States . . . . .	126
5.1. Two-Body Single Channel Scattering . . . . .	127
5.2. Many-Body Two-Particle Scattering States . . . . .	135
5.3. Variation Principles for Many-Body Scattering States . . . . .	143
5.4. Neutron–Deuteron Elastic Scattering . . . . .	152
5.5. Alternate Variational Principles for the Schrödinger . . . . .	167
Equation . . . . .	167
6. Variational Methods for the Faddeev Equations . . . . .	174
6.1. Variational Principle for Inhomogeneous Equations . . . . .	175

6.2. The Two-Body $t$ Matrix (DA 72) . . . . .	176
6.3. Variational Principle for the Faddeev Equations . . . . .	187
6.4. Alternative Principles for the Breakup Reaction . . . . .	193
7. Summing Up . . . . .	197
Acknowledgments . . . . .	198
Appendix A . . . . .	
Convergence of Variational Methods . . . . .	198
References . . . . .	219

## Chapter 2

### Nuclear Matter Calculations

Donald W. L. Sprung

1. Introduction . . . . .	225
1.1. Outline . . . . .	225
1.2. Introduction to the Theory . . . . .	226
2. Calculation of the $G$ Matrix . . . . .	239
2.1. General Principles . . . . .	239
2.2. Bethe–Goldstone Equation . . . . .	240
2.3. Kallio–Day Method . . . . .	243
2.4. Reduction to Partial Waves . . . . .	243
2.5. Day’s Derivation of the Radial Wave Equation . . . . .	246
2.6. Binding Energy . . . . .	249
2.7. The Brueckner Self-Consistency Problem . . . . .	252
3. Comparison of Methods for Constructing the $G$ Matrix . . . . .	254
3.1. Kallio–Day Method . . . . .	254
3.2. Köhler’s Method . . . . .	255
3.3. Related Methods . . . . .	257
3.4. Tabakin–Haftel Method . . . . .	258
3.5. Coester–Day–Vincent–Cohen Method . . . . .	259
3.6. Brueckner–Gammel Method . . . . .	260
3.7. Dahl–Ostgaard–Brandow Method . . . . .	261
3.8. Moszkowski–Scott Method . . . . .	261
3.9. Summary . . . . .	263
4. Results of Calculations for Realistic Forces . . . . .	264
4.1. Potentials Considered . . . . .	264
4.2. Results for Group One Potentials . . . . .	265
4.3. Importance of Various Partial Waves . . . . .	267
4.4. Results for OBEP and Supersoft-Core Forces . . . . .	272

4.5. Interpretation of OBEP Forces . . . . .	276
4.6. Mechanism of Saturation in Nuclear Matter . . . . .	277
4.7. Convergence of the Reference Spectrum Series . . . . .	280
4.8. Average Center of Mass Momentum . . . . .	282
4.9. Symmetry Energy . . . . .	283
5. Additional Considerations . . . . .	287
5.1. Minimal Relativity . . . . .	287
5.2. Three-Body Forces . . . . .	289
5.3. Phase Equivalent Potentials . . . . .	290
5.4. Nuclear Matter Without Potentials . . . . .	293
5.5. Saturation Conditions on the Two-Body Potential . . . . .	296
6. Higher-Order Cluster Contributions . . . . .	297
6.1. Three-Body Clusters . . . . .	297
6.2. Intermediate-State Potential Energy and Three-Body Clusters . . . . .	307
6.3. Four-Body Clusters in Nuclear Matter . . . . .	311
7. Toward Finite Nuclei . . . . .	314
7.1. Rationale . . . . .	314
7.2. Local Density Approximation . . . . .	315
7.3. Thomas–Fermi Theory . . . . .	316
7.4. Effective Potentials . . . . .	323
7.5. Neutron Star Matter . . . . .	332
8. Conclusion . . . . .	336
References . . . . .	338

*Chapter 3*

**Clustering in Light Nuclei**

**Akito Arima, Hisashi Horiuchi, Kuniharu Kubodera,  
and Noboru Takigawa**

1. Introduction . . . . .	345
1.1. Few Nucleon Correlations . . . . .	345
1.2. Clustering . . . . .	348
1.3. Four-Body Correlation . . . . .	354
1.4. Normal Shell Model States . . . . .	355
1.5. Excited Rotational Levels and Molecule-like Structure . . . . .	357
2. Shell Model and Deformed Hartree–Fock Model . . . . .	360
2.1. Shell Model . . . . .	360
2.2. Deformed Hartree–Fock Model . . . . .	364
3. Weak Coupling Model and Quartet States . . . . .	366

4. Cluster Model . . . . .	371
4.1. Cluster Wave Functions . . . . .	371
4.2. Brink's Method . . . . .	373
4.3. Generator Coordinate Method and Treatment of Relative Motion Between Clusters . . . . .	378
4.4. The LCCO Method . . . . .	380
4.5. Adiabatic Conditions. . . . .	383
4.6. Hamiltonian. . . . .	385
5. Individual Nuclei . . . . .	386
5.1. ${}^6\text{Li}$ . . . . .	386
5.2. ${}^8\text{Be}$ . . . . .	398
5.3. ${}^{12}\text{C}$ . . . . .	401
5.4. ${}^{20}\text{Ne}$ . . . . .	408
5.5. ${}^{16}\text{O}$ . . . . .	419
6. Electromagnetic Properties and Form Factors for Electron Scattering . . . . .	420
6.1. ${}^6\text{Li}$ . . . . .	421
6.2. ${}^{12}\text{C}$ . . . . .	426
6.3. ${}^{20}\text{Ne}$ . . . . .	435
7. Comparison Between Models in the Normal Shell Model States	438
8. Effect of the Spin-Orbit Interaction and Hybridization . . . . .	343
9. Exotic States and Alpha Particle Widths . . . . .	449
9.1. The Alpha-Particle Width . . . . .	449
9.2. Alpha Transfer Reactions . . . . .	461
10. Discussion and Possible Further Developments . . . . .	468
Appendix: Matrix Elements Between Two Brink Wave Functions	470
References . . . . .	472
<b>Index</b> . . . . .	479
