

CONTENTS

Chapter 1

CLUSTERING PHENOMENA AND HIGH-ENERGY REACTIONS

**V. G. Neudatchin, Yu. F. Smirnov, and
N. F. Golovanova**

1.	Introduction	1
2.	The Translationally Invariant Shell Model	5
2.1.	Classification of the States	5
2.2.	The Transition from One Set of Jacobi Coordinates to Another Set in the Wave Functions of the TISM	10
2.3.	The Fractional Parentage Coefficients in the TISM and Calculation of the Operator Matrix Elements	13
2.4.	Methods for Calculating the Fractional Parentage Coefficients	15
2.5.	Relation of the Fractional Parentage Coefficients in TISM to the Conventional Fractional Parentage Coefficients	19
3.	General Theory of the Many-Particle Fractional Parentage Coefficients	22
3.1.	Standard Irreducible Representations of the Permutation Group. The Young Operators	22
3.2.	Transformation Matrices for the Transition from the Standard to Nonstandard Representation of the Permutation Group	25
3.3.	Calculations of One-Particle Fractional Parentage Coefficients	29
3.4.	Calculations of the Many-Particle Fractional Parentage Coefficients in Terms of Coefficients of Separation of a Smaller Number of Particles	33

3.5. A More General Method for Calculating the Orbital Many-Particle Fractional Parentage Coefficients. The Total Fractional Parentage Coefficients	37
3.6. Two Methods for Constructing the Wave Functions with Given Total Young Diagram for Mixed Configurations	41
3.7. Racah Coefficients and $9V$ Symbols for Group $SU(4)$ and Their Properties	45
3.8. Fractional Parentage Coefficients for the States of Mixed Configurations with Given Total Young Scheme	49
3.9. The Kaplan Matrices and nj Symbols for Group $SU(n)$	52
3.10. Many-Particle Fractional Parentage Coefficients in the TISM	55
4. Cluster Spectroscopic Factors for p -Shell Nuclei.	60
4.1. General Remarks	60
4.2. The Nuclear sp States in the TISM	63
4.3. Fractional Parentage Coefficients for the Transition to the Hole States of the Final Nucleus	66
4.4. Cluster Coefficients and Coefficients Ω	68
4.5. Examples	72
5. Quasielastic Knockout of Clusters from Atomic Nuclei by High-Energy Hadrons	75
5.1. Introductory Remarks	75
5.2. Scattering of Maximum Multiplicity	78
5.3. Interference of the Amplitudes of Various Multiplicities	87
5.4. Anisotropy in the Young-Treimann Angle	94
5.5. Results and Discussion	95
5.6. Calculations of the Cluster Parentage Coefficients.	104
6. Consideration of Distortions	109
6.1. Statement of the Problem in the Lippmann-Schwinger Formalism	109
6.2. Distortion of the Wave Function of a Fast Incident Hadron	114
6.3. Distortion in the Cluster-Residual-Nucleus Channel . .	117
6.4. Quasielastic Triton Knockout from the ${}^6\text{Li}$ Nucleus Including All Scattering Multiplicities	120
7. Conclusions	126
References	130

*Chapter 2***PION PRODUCTION IN PROTON-NUCLEUS COLLISIONS****B. Höistad**

1. Introduction	135
2. General Survey of Characteristic Features in the (p, π) Data	138
2.1. Experimental Technique	138
2.2. Experimental Results of Positive Pion Production at 185 MeV	139
2.3. Experimental Results of (p, π) Measurements at High Energies	143
2.4. The Dependence of the Target Mass in the (p, π) Cross Section	144
2.5. Experimental Results from Negative Pion Production	147
2.6. Pion Production with Polarized Protons	149
3. Brief Review of Current Theoretical Interpretations	150
3.1. The One-Nucleon Model	153
3.2. The Two-Nucleon Models	164
4. The Energy Dependence of the (p, π) Reaction	169
5. Summary and Final Remarks	175
Acknowledgments	176
References	176

*Chapter 3***FOURTEEN YEARS OF SELF-CONSISTENT FIELD CALCULATIONS: WHAT HAS BEEN LEARNED****J. P. Svenne**

1. Introduction	179
2. Self-Consistent Field	183
2.1. Hartree-Fock Equations	184
2.2. Brueckner-Hartree-Fock Equations	188
2.3. Renormalized Brueckner-Hartree-Fock	194
2.4. Density-Dependent Hartree-Fock	197
2.5. The $\exp\{S\}$ Formalism	199

3.	Nucleon–Nucleon Interaction	205
3.1.	Model Potentials	205
3.2.	Semiphenomenological Interactions	206
3.3.	Realistic Interactions	207
3.4.	Field-Theoretic Interactions	209
3.5.	Density-Dependent Interactions	209
4.	Results of Calculations	210
4.1.	Binding Energy and Radius	211
4.2.	Single-Particle Energies	231
4.3.	Density Distributions in Spherical Nuclei	235
4.4.	Deformation Parameters	237
4.5.	Rotational Bands	245
5.	Critical Discussion	247
Acknowledgments		251
References		251

Chapter 4

HARTREE–FOCK–BOGOLIUBOV THEORY WITH APPLICATIONS TO NUCLEI

Alan L. Goodman

1.	Introduction	263
2.	HFB Theory	266
2.1.	The Hamiltonian	267
2.2.	External Constraints	268
2.3.	Quasiparticle Transformation	271
2.4.	Wick’s Theorem	272
2.5.	Equations of Motion	274
2.6.	Solving the HFB Equations	275
2.7.	Generalized Density Matrix	277
3.	Relationship between HFB and HF–BCS	280
3.1.	Canonical Representation	280
3.2.	Bloch–Messiah Theorem	281
3.3.	Conditions for the Equivalence of HFB and HF–BCS	283
4.	Symmetries	287
4.1.	Self-Consistent Symmetries	288

4.2. Propagating Symmetries	288
4.3. Parity	288
4.4. Time Reversal	289
4.5. Complex Conjugation	291
4.6. Triaxial Symmetry	291
4.7. Axial Symmetry	292
4.8. Spherical Symmetry	292
4.9. Rotating Frames	293
4.10. Number Parity and Negative Quasiparticle Energies	296
4.11. Isospin Symmetries and Neutron-Proton Pairing	297
5. Light Nuclei	303
5.1. Neutron–Neutron and Proton–Proton Pairing	303
5.2. Neutron–Proton Pairing	306
5.3. Model Space Truncation Effects	313
6. Heavy Nuclei	315
6.1. Equilibrium Properties of the Nonrotating Intrinsic State	315
6.2. Backbending Spectra	326
6.3. Angular-Momentum-Dependent Quasiparticle Vacuum	331
6.4. Coriolis Antipairing	333
6.5. Pair Realignment	336
6.6. Forking Bands	339
6.7. Gapless Superconductivity	340
6.8. Shape Transitions	341
6.9. Attenuation Factor in Odd-Mass Nuclei	344
6.10. Projection of Angular Momentum and Particle Number	346
7. Comparison of HFB with Exact Solutions in Soluble Models	351
7.1. Particle-plus-Rotor Models	351
7.2. R(5) Model without Rotor	352
7.3. R(8) Model: Positive-Parity States	354
7.4. R(8) Model: Negative-Parity States	355
7.5. $i_{13/2}$ Model	356
7.6. R(6) Model	357
8. Summary and Prospects	360
Acknowledgments	362
References	362

*Chapter 5***HAMILTONIAN FIELD THEORY FOR SYSTEMS
OF NUCLEONS AND MESONS****Mark Bolsterli**

1. Introduction	367
2. The Phenomenological Hamiltonian	372
3. The Mean-Field Approximation	378
4. Vector Fields	385
5. The Shell-Model Energy Functional for Vector Fields	391
6. Infinite Nuclear Matter	393
7. The Mean-Field Approximation for the Single Fermion	397
8. Translation of Localized States	403
9. Static Sources and Coherent States	408
10. Prospects	413
Acknowledgments	414
References	414
 <i>Index</i>	417
