Chapter 1

SINGLE-PARTICLE MOTION IN NUCLEI

C. Mahaux and R. Sartor

1.	Introduction	1
2.	The Phenomenological Shell-Model Potential	4
2.1.	Single-Particle Wave Equation	5
2.2.	Single-Particle Energies	6
3.	Quasiparticle Excitations	9
3.1.	Configuration Mixing	10
3.2.	Single-Particle Excitations	11
3.3.	Quasihole and Quasiparticle Excitations	14
3.4.	Effect of the Continuum	15
3.5.	Discussion	18
4.	The Optical Model	18
4.1.	Single-Particle Wave Equation	19
4.2.	Phenomenological Optical-Model Potentials	20
4.3.	Generalized Optical-Model Potentials	22
4.4.	Discussion	24
5.	Nuclear Matter	25
5.1.	Momentum Distribution	26
5.2.	Optical Model in Nuclear Matter	27
5.3.	Single-Particle Green's Function	27
5.4.	Spectral Functions	30
5.5.	Lehmann Representation	32
5.6.	Mass Operator	33

5.7.	Quasiparticle Approximation	35
5.8.	Effective Masses	38
5.9.	Mean Removal Energy and Average Binding Energy	39
5.10.	Perturbation Expansion	40
5.11.	Dispersion Relations	49
5.12.	Brueckner-Hartree-Fock Approximation	50
5.13.	Second Order in the Reaction Matrix	53
5.14.	Third Order in the Reaction Matrix	54
5.15.	Hole-Line Expansion	58
5.16.	Numerical Results	60
5.17.	Discussion	68
6.	Microscopic Theory of Single-Particle Properties	70
6.1.	Introduction	70
6.2.	Natural Orbitals	71
6.3.	Maximum Overlap Orbitals	75
6.4.	Overlap Functions	76
6.5.	Green's Functions	85
6.6.	Spectral Functions	87
6.7.	Sum Rules	88
6.8.	Noninteracting System	90
6.9.	Mass Operator	93
6.10.	Particle and Hole Green's Functions	93
6.11.	Overlap Functions for Bound States	94
6.12.	Overlap Functions for Scattering States	95
6.13.	Analytical Properties	96
6.14.	Perturbation Expansion	99
6.15.	Bilinear Expansion	113
6.16.	The Mean Field	116
6.17.	Quasiparticle States	124
6.18.	Sum Rules	127
6.19.	Analysis of Experimental Data	129
6.20.	Discussion	130
7.	Construction of the Mean Field at Positive and Negative Energies	132
7.1.	Microscopic Calculations	132
7.2.	Practical Form of the Dispersion Relation	135
7.3.	Parametrization of the Imaginary Part of the Mean Field	139
7.4.	Dispersive Contribution to the Real Part	142
7.5.	Hartree-Fock-Type Contribution	144
7.6.	Comparison with Empirical Potentials and Experimental Cross Sections	147
7.7.	Effective Mass	153

7.8.	Single-Particle Energies	154
7.9.	Practical Approximation for the Spectral Function	155
7.10.	Valence Shells	158
7.11.	Spectral Function of Bound Quasiparticle States	159
7.12.	Quasibound States	160
7.13.	Principal Quantum Numbers	160
7.14.	Quasiparticle Widths	162
7.15.	Average Effective Mass	165
7.16.	Root-Mean-Square Radii	165
7.17.	Occupation Probabilities	165
7.18.	Summed Spectroscopic Strengths	166
7.19.	A Sum Rule Limit?	170
7.20.	Comparison with Related Previous Analyses	172
7.21.	Influence of the High Energy Parametrization of the Imaginary Part	174
7.22.	The Proton- ²⁰⁸ Pb System	181
7.23.	Measurement of Spectroscopic Factors	195
7.24.	Can Occupation Probabilities Be Measured?	196
7.25.	Other Nuclei	200
7.26.	Discussion	203
8.	Overview	205
	References	216

*Chapter 2***RELATIVISTIC HAMILTONIAN DYNAMICS IN
NUCLEAR AND PARTICLE PHYSICS****B. D. Keister and W. N. Polyzou**

1.	Introduction	226
2.	Relativistic Quantum Mechanics: Principles and Examples . . .	231
2.1.	Relativistic Invariance	232
2.2.	Historical Perspective	234
2.3.	Example: Confined Spinless Quarks	246
2.4.	Example: Confined Relativistic Quarks—With Spin	257
2.5.	Example: Spinless Two-Particle Scattering	263
2.6.	Example: Nucleon-Nucleon Scattering—With Spin	277
2.7.	Summary of Examples	284

3.	Symmetries in Quantum Mechanics	285
3.1.	Galilean Relativity	288
3.2.	Special Relativity—The Poincaré Group	292
3.3.	Parameterization of Poincaré Transformations	294
3.4.	Definition of Infinitesimal Generators	295
3.5.	Commutation Relations—Canonical Form	295
3.6.	Commuting Self-Adjoint Operators	298
3.7.	Other Considerations	305
4.	The One-Body Problem: Irreducible Representations	306
4.1.	The Hilbert Space	307
4.2.	Unitary Representations	309
4.3.	Lie Algebra	314
4.4.	Position in Relativity	318
4.5.	Summary	320
5.	The Two-Body Problem	321
5.1.	The Two-Body Hilbert Space	322
5.2.	Relativistic Dynamics of Two Free Particles	322
5.3.	Clebsch-Gordan Coefficients	323
5.4.	Free-Particle Generators and Other Operators	329
5.5.	The Bakamjian-Thomas Construction	332
5.6.	Special Cases	337
6.	The $2 + 1$ Body Problem	343
6.1.	Macroscopic Locality and the $2 + 1$ Body Problem	344
6.2.	The Three-Body Hilbert Space	348
6.3.	Two $2 + 1$ Body Models	351
6.4.	Packing Operators	356
7.	The Three-Body Problem	361
7.1.	Three-Body Constructions	362
7.2.	Faddeev Equations	374
7.3.	Symmetric Coupling Schemes	382
7.4.	Remarks	390
8.	Particle Production	390
8.1.	The Hilbert Space	392
8.2.	Free-Particle Dynamics	394
8.3.	Interactions	397
8.4.	Macroscopic Locality	401
9.	Electromagnetic Currents and Tensor Operators	405
9.1.	Basic Formulas and Observables	406
9.2.	Matrix Elements and Invariants	412
9.3.	Computation of Composite Form Factors	429

Contents	xvii
10. Relation to Covariant Theories	439
11. Conclusion	449
Appendix A: Scattering Theory	452
A.1. The Relation Between S and T	453
A.2. The Invariance Principle	457
A.3. Cross Sections	460
A.4. Phenomenological Interactions	465
Appendix B: Front-Form Kinematics	468
Appendix C: Racah Coefficients	473
References	475
Index	481
