

Contents of Part B

CONTRIBUTORS TO PART B	v
PREFACE	vii
CONTRIBUTORS TO PART A	xiii
CONTENTS OF PART A	xv

V. Theoretical Analysis of the Data

V. A. The Compound Nucleus	625
BY HERMAN FESHBACH	
1. Elastic and Inelastic Potential Scattering Amplitudes	629
2. Resonance Amplitudes for Isolated Resonances	631
3. Properties of the Widths	631
4. Total Elastic Cross Section	634
5. Reaction Cross Sections	639
6. Total Cross Section	645
7. Angular Distribution for Reactions	646
8. Angular Distribution for Elastic Scattering of Neutral Particles	646
9. Angular Distribution for the Elastic Scattering of Charged Particles	649
10. Gamma Rays in Nuclear Reactions	652
11. Polarization	654
12. Overlapping Levels	660
13. Many Overlapping Levels. Statistical Theory	661
14. Density of Levels	668
V. B. Direct Interactions	670
1. Direct Interactions in Inelastic Scattering	670
BY C. A. LEVINSON	
2. The Theory of Stripping and Pickup Reactions	695
BY M. K. BANERJEE	
V. C. Angular Correlations in Nuclear Spectroscopy	732
BY L. C. BIEDENHARN	
1. The Angular Correlation Process	736
2. Application of Angular Correlations to Specific Cases	769
3. Appendix: Summary of Formulas and Notations	800

V. D. Analysis of Beta Decay Data	811
By M. E. ROSE	
1. The Role of Beta Decay in Nuclear Physics	813
2. Outline of the Theory	815
3. The Energy Distribution and Angular Correlation: Allowed Transitions	819
4. Analysis of the Shapes of Allowed Spectra	820
5. Forbidden Spectra	821
6. Corrections to the Spectral Shapes	824
7. <i>ft</i> Values	825
8. Failure of Parity Conservation	829
9. Orbital Capture	830
V. E. Analysis of Internal Conversion Data	834
By M. E. ROSE	
1. Definition of the Process	834
2. The Selection Rules. Mixtures of Multipoles	836
3. The Calculation of Internal Conversion Coefficients	838
4. Numerical Values of Internal Conversion Coefficients	850
V. F. Analysis of Gamma Decay Data	852
By D. H. WILKINSON	
1. Modes of De-excitation	852
2. General Selection Rules for Electromagnetic Transitions	853
3. Internal Conversion	857
4. Nomenclature	857
5. Isotopic Spin Selection Rules	858
6. Units of Transition Strength	858
7. The Independent-Particle Model	863
8. Methods of Observation	865
9. Empirical Data: the Light Elements	867
10. Empirical Data: the Heavy Elements	872
11. Special Selection Rules	879
12. Branching Ratios	882
13. Sum Rules	882
V. G. The Analysis of Reduced Widths	890
By J. B. FRENCH	
1. Single-Particle Widths	891
2. Selection Rules	894
3. Quantitative Analysis via the Shell Model	901
4. Miscellaneous Considerations	915

CONTENTS OF PART B

xi

V. H. Isotopic Spin Selection Rules	932
By WILLIAM M. MACDONALD	
1. Isotopic Spin Vector Operator	933
2. Isotopic Spin of Nuclear States	934
3. Coulomb Perturbation of Isotopic Spin States	940
4. Nuclear Reactions	946
5. Validity of the Isotopic Spin Quantum Number	957
 VI. Nuclear Models	
VI. A. The Nuclear Shell Model	963
By R. D. LAWSON	
1. Evidence for Magic Numbers	964
2. The Shell Model	968
VI. B. Nuclear Coupling Schemes	983
By D. KURATH	
1. Fundamental Coupling Procedure	984
2. Many-Particle Spectra	997
3. Intermediate Coupling in Light Nuclei	1002
VI. C. Collective Motion and Nuclear Spectra	1009
By A. BOHR AND B. R. MOTTELSON	
1. Vibrational Spectra	1012
2. Deformed Nuclei	1014
3. A Survey of the Low-Energy Nuclear Spectra	1023
VI. D. The Complex Potential Model	1033
By HERMAN FESHBACH	
1. The Average Cross Sections and Average Wave Amplitudes	1034
2. Empirical Determination of the Complex Potential	1045
 Appendices	
Appendix I. Physical Constants	1065
Appendix II. Table of Isotopes	1066
By D. STROMINGER	
AUTHOR INDEX (PART B)	1105
SUBJECT INDEX (PARTS A AND B)	1114
