

CONTENTS

Preface	vii
1 Path integrals	1
Problem	4
References	4
2 Path integrals in non-relativistic quantum mechanics	5
2.1 Transition amplitudes as path integrals	5
2.2 The ground-state-to-ground-state amplitude, $W[J]$	8
2.3 Ground-state expectation values from $W[J]$	11
Problems	14
References	14
3 Classical field theory	15
3.1 Euler–Lagrange equations	15
3.2 Noether’s theorem	18
3.3 Scalar field theory	20
3.4 Spinor field theory	25
3.5 Massless vector field theory	33
Problems	37
References	38
4 Quantum field theory of a scalar field	39
4.1 The generating functional $W[J]$	39
4.2 The generating functional for free-field theory	42
4.3 Green functions for free-field theory	45
4.4 The effective action and one-particle-irreducible Green functions	47
Problems	50
References	50

5 Scattering amplitudes	51
5.1 Scattering amplitude in quantum mechanics	51
5.2 Scattering amplitude in quantum field theory	54
References	59
6 Feynman rules for $\lambda\varphi^4$ theory	60
6.1 Perturbation theory	60
6.2 Momentum space Feynman rules	64
6.3 One-particle-irreducible Green functions	66
6.4 Scattering amplitudes	67
6.5 Calculation of the scattering cross section	70
Problems	73
References	73
7 Renormalisation of $\lambda\varphi^4$ theory	74
7.1 Physical motivation for renormalisation	74
7.2 Dimensional regularisation	79
7.3 Evaluation of Feynman integrals	81
7.4 Renormalisation of $\lambda\varphi^4$ theory at one-loop order	85
7.5 Renormalisation schemes	90
Problems	94
References	94
8 Quantum field theory with fermions	96
8.1 Path integrals over Grassmann variables	96
8.2 The generating functional for spinor field theories	99
8.3 Propagator for the Dirac field	100
8.4 Renormalisable theories of Dirac fields and scalar fields	101
8.5 Feynman rules for Yukawa interactions	103
8.6 Massless fermions	106
8.7 Scattering amplitudes with fermions	107
Problems	109
References	109
9 Gauge field theories	110
9.1 Abelian gauge field theory	110
9.2 Non-Abelian gauge field theories	112
9.3 Field equations for gauge field theories	115
References	115

10 Feynman rules for quantum chromodynamics and quantum electrodynamics	116
10.1 Quantum chromodynamics	116
10.2 Problems in quantising gauge field theories	116
10.3 An analogy with ordinary integrals	118
10.4 Quantisation of gauge field theory	119
10.5 Gauge fixing terms and Faddeev–Popov ghosts	123
10.6 Feynman rules for gauge field theories	125
10.7 Scattering amplitudes with gauge fields	129
Problems	129
References	130
11 Renormalisation of QCD and QED at one-loop order	131
11.1 Counter terms for gauge field theories	131
11.2 Calculation of renormalisation constants	133
11.3 The electron anomalous magnetic moment	140
Problems	143
References	143
12 QCD and asymptotic freedom	144
12.1 The renormalisation group equation	144
12.2 Deep inelastic electron–nucleon scattering	149
12.3 The Wilson operator product expansion	152
12.4 Wilson coefficients and moments of structure functions	154
12.5 Renormalisation group equation for Wilson coefficients	157
12.6 Calculation of anomalous dimensions	159
12.7 Comparison with experiment, and Λ_{QCD}	163
12.8 e^+e^- annihilation	165
Problems	167
References	168
13 Spontaneous symmetry breaking	169
13.1 Introduction	169
13.2 Spontaneous symmetry breaking in a ferromagnet	172
13.3 Spontaneous breaking of a discrete symmetry	173
13.4 Spontaneous breaking of a continuous global symmetry	175
13.5 The Higgs mechanism	180
13.6 The Higgs mechanism in non-Abelian theories	185

13.7	Fermion masses from spontaneous symmetry breaking	190
13.8	Magnetic monopoles	193
13.9	The effective potential in one-loop order	200
	Problems	212
	References	212
14	Feynman rules for electroweak theory	214
14.1	SU(2) \times U(1) invariance and electroweak interactions	214
14.2	Spontaneous breaking of SU(2) \times U(1) local gauge invariance	219
14.3	Feynman rules for the vertices	224
14.4	Tests of electroweak theory	232
14.5	Inclusion of hadrons	236
	Problems	242
	References	242
15	Renormalisation of electroweak theory	244
15.1	Electroweak theory renormalisation schemes	244
15.2	Definition of the renormalised parameters	246
15.3	Evaluation of the renormalisation constants	258
15.4	Radiative corrections to muon decay	269
15.5	Anomalies	272
	Problems	280
	References	281
16	Grand unified theory	282
16.1	Philosophy	282
16.2	SU(5) grand unified theory	283
16.3	The grand unification scale and θ_W	289
16.4	Spontaneous symmetry breaking for SU(5) grand unified theory	291
16.5	Fermion masses in SU(5)	294
16.6	Proton decay	297
	Problems	298
	References	298
17	Field theories at finite temperature	299
17.1	The partition function for scalar field theory	299
17.2	Partition function for free scalar field theory	301
17.3	Partition function for gauge vector bosons	304

17.4 Partition function for fermions	306
17.5 Temperature Green functions and generating functionals	308
17.6 Finite temperature generating functional for a free scalar field	311
17.7 Feynman rules for temperature Green functions	312
17.8 The finite temperature effective potential	312
17.9 Finite temperature effective potential at one-loop order	314
17.10 The Higgs model at finite temperature	318
17.11 Electroweak theory at finite temperature	320
17.12 Grand unified theory at finite temperature	322
17.13 First-order phase transitions	323
Problems	327
References	328
 Appendix A: Feynman integrals in 2ω -dimensional space	329
 Appendix B: S -matrix elements are independent of ξ	330
 Appendix C: C.1 Vector–vector–scalar–scalar vertices	335
C.2 Vertices involving four scalars	337
 Appendix D: $SU(5)$ λ matrices	339
 Appendix E: Matsubara frequency sums	342
 Index	343
