## INTRODUCTION

|                  |                                 |          |
|------------------|---------------------------------|----------|
| <b>Chapter 1</b> | <b>Why Quarks?</b>              | <b>3</b> |
| 1.1              | Hadron spectroscopy             | 5        |
| 1.2              | Hadron substructure and scaling | 12       |

## PART 1 SYMMETRIES, HADRON SPECTROSCOPY AND QUARKS

|                  |                                                      |           |
|------------------|------------------------------------------------------|-----------|
| <b>Chapter 2</b> | <b><math>SU(N)</math> Symmetries</b>                 | <b>17</b> |
| 2.1              | Multiplets and quarks                                | 17        |
| 2.2              | Rudiments of unitary symmetry: $SU(N)$               | 21        |
| <b>Chapter 3</b> | <b>Quarks and <math>SU(N)</math> Representations</b> | <b>38</b> |
| 3.1              | Baryons                                              | 39        |
| 3.2              | $SU(2)$ representations                              | 40        |
| 3.3              | $SU(3)$ representations                              | 44        |
| 3.4              | $SU(N)$ and Young tableaux                           | 47        |

|                  |                                                                                                             |            |
|------------------|-------------------------------------------------------------------------------------------------------------|------------|
| <b>Chapter 4</b> | <b>SU(6): Quarks with Spin</b>                                                                              | <b>54</b>  |
| 4.1              | Mesons                                                                                                      | 54         |
| 4.2              | Baryons                                                                                                     | 59         |
| 4.3              | Examples of simple calculations                                                                             | 62         |
| 4.4              | Mass splittings in the hadron supermultiplets                                                               | 70         |
| <br>             |                                                                                                             |            |
| <b>Chapter 5</b> | <b>SU(6) <math>\times</math> O(3): Quarks with Orbital Excitation</b>                                       | <b>80</b>  |
| 5.1              | Baryons                                                                                                     | 80         |
| 5.2              | Mesons                                                                                                      | 86         |
| 5.3              | Mass splittings in $L > 0$ supermultiplets                                                                  | 88         |
| <br>             |                                                                                                             |            |
| <b>Chapter 6</b> | <b>Quark-Current Interactions:<br/>Symmetries and Dynamics of Decay Vertices</b>                            | <b>93</b>  |
| 6.1              | U(6) $\times$ U(6) and SU(6)                                                                                | 93         |
| 6.2              | SU(6) <sub>W</sub> and states in motion with $p_z \neq 0$                                                   | 95         |
| 6.3              | A model with SU(6) <sub>W</sub> $\times$ O(2) <sub>L,z</sub> vertex symmetry: duality<br>diagrams with spin | 101        |
| 6.4              | SU(6) <sub>W</sub> of currents                                                                              | 104        |
| 6.5              | The SU(3) subalgebra of SU(6) <sub>W</sub>                                                                  | 110        |
| 6.6              | SU(3) $\times$ SU(3) configuration mixing in the harmonic oscillator<br>quark model                         | 115        |
| 6.7              | Quark pair creation and SU(6) <sub>W</sub> breaking                                                         | 119        |
| <br>             |                                                                                                             |            |
| <b>Chapter 7</b> | <b>Electromagnetic Interactions and Radiative<br/>Transitions in Explicit Models</b>                        | <b>126</b> |
| 7.1              | Quark spin flip matrix elements                                                                             | 127        |
| 7.2              | Quark model amplitudes for resonance photoexcitation                                                        | 131        |
| 7.3              | Current matrix elements—a general approach                                                                  | 143        |
| 7.4              | Relativistic models                                                                                         | 147        |
| 7.5              | Electromagnetic interactions in the $^3P_0$ model                                                           | 155        |
| 7.6              | Massive quark models                                                                                        | 157        |

|                                                                                        |            |

| <br>              |                                                                                                                      |            |
| <b>Chapter 15</b> | <b>Introduction to the Phenomenology of<br/>Non-Abelian Gauge Theories</b>                                           | <b>331</b> |
| 15.1              | Non-Abelian gauge theories of weak-electromagnetic inter-<br>actions                                                 | 332        |
| 15.2              | Quantum chromodynamics: a non-Abelian gauge field theory<br>of strong interactions                                   | 336        |

|                                                                  |            |
|------------------------------------------------------------------|------------|
| <b>Chapter 16 The New Particles</b>                              | <b>348</b> |
| 16.1 Charmonium                                                  | 348        |
| 16.2 Charmonium decays in quantum chromodynamics                 | 354        |
| 16.3 The charmonium spectroscopy                                 | 364        |
| 16.4 Charmed particles                                           | 376        |
| 16.5 Weak decays of charmed hadrons                              | 381        |
| <b>Chapter 17 Hadron Mass Shifts in Field Theories</b>           | <b>386</b> |
| 17.1 Fine and hyperfine structure in atomic and quark physics    | 386        |
| 17.2 Spin-dependent mass splittings for baryons                  | 387        |
| 17.3 Fermi–Breit Hamiltonian in QCD                              | 396        |
| 17.4 Spin–spin splitting and meson spectroscopy                  | 398        |
| 17.5 Electromagnetic mass shifts                                 | 400        |
| 17.6 Gluon contributions, pseudoscalar and vector meson masses   | 405        |
| <b>Chapter 18 Quarks Confined to a Sphere: The MIT Bag Model</b> | <b>410</b> |
| 18.1 Free quarks confined to a sphere                            | 411        |
| 18.2 Gluons in the bag and hyperfine splitting                   | 421        |
| 18.3 Act of confinement                                          | 426        |
| 18.4 Glueballs                                                   | 426        |
| <b>Chapter 19 Multiquark Hadrons</b>                             | <b>429</b> |
| 19.1 $q\bar{q}$ and $qqq$ states in QCD                          | 429        |
| 19.2 Colour singlet $q^2\bar{q}^2$ mesons                        | 430        |
| 19.3 The spin-dependent splitting of $q^2\bar{q}^2$ states       | 436        |
| <b>Chapter 20 Quark–Lepton Unification</b>                       | <b>442</b> |
| 20.1 Quarks and leptons                                          | 442        |
| 20.2 Grand unification                                           | 445        |
| <i>Bibliography</i>                                              | 449        |
| <i>References</i>                                                | 453        |
