CONTENTS

Symbols and abbreviations 11
Chapter 1. Nuclear reactions 15
1.1 Introduction 15
1.2 Kinematics and consequences 16
1.2.1 Kinematical relations 16
1.2.2 Particle detection 22
1.2.3 Particle spectra 23
1.3 Classification of nuclear reactions 25
1.3.1 Elastic scattering 25
1.3.2 Inelastic scattering 25
1.3.3 Rearrangement collisions 26
1.3.4 Many-body reactions 26
1.3.5 Photonuclear reactions 27
1.3.6 Radiative capture 27
1.4 Reaction mechanisms 28
1.5 Nuclear reaction cross sections 28
1.5.1 Definition 28
1.5.2 Elastic scattering of charged particles 30
1.5.3 Resonances 34
1.5.4 Evaporation of particles 37
1.5.5 Excitation functions 41
Low energy 41
High energy 42
1.5.6 Stripping reactions 45
1.5.7 Photoproduction of particles 47
References 48
Chapter 2. Interaction of charged particle beams with solid samples 50
2.1 Ionization following charged particle bombardment 50
2.2 X-ray emission following charged particle bombardment 52
2.2.1 X-ray emission 52
2.2.2 Elemental analysis using X-ray fluorescence induced by charged particles 54
2.2.3 Secondary electrons 56
2.3 Energy loss of charged particles in matter 57
2.3.1 Introduction 57
2.3.2 Stopping power parameters 57
2.3.3 Chemical combination and aggregation effects 61

2.3.4 Charged particle range 62
2.3.5 Energy straggling 64
2.4 Channeling effects 73
References 74
Chapter 3. Analysis by elastic scattering of charged particles 76
3.1 Introduction 76
3.2 Kinematics 78
3.2.1 Scattered particle energy 78
3.2.2 Transformations between coordinate systems 80
3.2.3 Mass resolution 81
3.2.4 Particle spectra 84
3.3 Elastic scattering cross section 85
3.3.1 Rutherford scattering 85
3.3.2 Low energy limitation 86
3.3.3 High energy limitations for heavy ions 86
3.3.4 Proton scattering 88
3.4 Backscattering from solid samples 89
3.4.1 Introduction 89
3.4.2 Calculation of the scattered yield 90
3.4.3 Energy spreading 95
3.5 Applications of backscattering to elemental analysis 100
3.5.1 Stoichiometry 100
3.5.2 Thin layer analysis 102
3.5.3 Depth profile measurements 103
3.5.4 Stopping power measurements 105
3.5.5 Energy straggling measurements 105
3.5.6 Resonant reactions and applications 105
3.5.7 Channeling in single crystal analysis 107
3.5.8 Optimum beam characteristics for backscattering measurements 109
(a) Projectile choice 109
(b) Beam size 109
(c) Target effects 110
(d) Accelerator 110
References 111
Chapter 4. Analysis by gamma-ray detection 112
4.1 Gamma-rays from nuclear reactions 112
4.1.1 Prompt methods 112
4.1.2 Delayed methods 114
4.2 Kinematical effects 114
4.2.1 Recoil effects 114
4.2.2 Doppler effects 116
4.2.3 Thermal motion 117
4.2.4 Nuclear reactions recoils 118
4.3 Nuclear reaction mechanisms 122
4.3.1 Resonant reactions 122
(a) Proton capture 122
(b) Other reactions 124
4.3.2 Non resonant cross sections (heavy nuclei) 125

4.3.3 Photonuclear reactions 126
(a) Thomson scattering 126
(b) Fluorescence scattering 126
(c) Gamma-rays from isomeric states 128
(d) Particle photoproduction 129
4.4 Prompt gamma-ray yield from thick sample bombardment 130
4.4.1 Thick target excitation yield 130
4.4.2 Non resonant cross sections 132
4.4.3 Broad resonances 133
4.4.4 Narrow resonances 134
4.4.5 Practical formula 134
4.4.6 Experimental determination of the product $\Gamma\sigma$ 138
4.5 Elemental analysis by prompt gamma-ray detection 139
4.5.1 Prompt gamma-rays from charged particle bombardment 139
(a) Concentration determination of light atoms in very thin layers (100–2000 Å) 139
(b) Concentration determination in thin layers (low Z) 141
(c) Thickness determination of thin layers 142
(d) Total weight of light atom traces in thin layers 143
(e) Total weight of heavy atom traces in a thin layer 143
(f) Thick layer analysis 144
(g) Depth profile determination of light elements 145
(h) Experimental limitations 147
4.5.2 Analysis by nuclear resonant scattering of gamma-rays 148
4.6 Elemental analysis by delayed methods 149
4.6.1 Charged particle activation 149
(a) Production of isotopes 149
(b) Residual radioactivity measurement 152
(c) Irradiation devices 153
(d) Applications 155
4.6.2 Photoactivation, isomeric metastable states 156
4.6.3 Photoactivation (γ, n), (γ, p) reactions 157
References 158
Chapter 5. Analysis by charged particle and neutron spectroscopy 160
5.1 Introduction 160
5.2 Reaction cross sections 160
5.2.1 Rearrangement collisions 160
5.2.2 Stripping reactions 161
5.2.3 (p, n) reactions 163
5.3 Kinematics of rearrangement collisions 164
5.3.1 Kinematical formulae 164
5.3.2 Consequences 165
5.4 Particle spectra 168
5.4.1 Charged particles 168
(a) Detectors 168
(b) Absorbers 170
5.4.2 Neutron emission 172
(a) Fast neutron spectra 172

(b) Thermal neutron detection 173
5.5 Solid sample bombardment 174
5.5.1 Charged particles 174
(a) Geometry 174
(b) Thin layers 176
(c) General formulae 176
(d) Simple approximations 178
(e) Straggling effects 180
5.5.2 Neutrons 181
(a) Thermal neutrons 181
(b) Fast neutrons 182
5.6 Analytical applications 183
5.6.1 Total weight of thin layers ($x < 1\mu m$) 183
5.6.2 Depth profile analysis ($1 < x \leqslant 10\mu m$) 184
5.6.3 Profile analysis by resonant (p, α) reactions 186
5.6.4 Depth profile analysis by (p, n) reactions 187
5.6.5 Contamination problems 188
References 188
Chapter 6. Analytical applications of nuclear reactions 189
6.1 Introduction 189
6.2 Sensitivity 189
6.3 Light element determination by delayed techniques 190
6.3.1 Charged particle activation 190
6.3.2 Photoactivation 192
6.4 Light element determination by prompt radiation detection 192
6.5 Heavy elements 200
6.5.1 Prompt nuclear reactions 200
6.5.2 Backscattering 200
6.5.3 X-ray fluorescence 201
6.5.4 Photonuclear reactions 201
6.5.5 Charged particle activation (delayed technique) 201
6.5.6 Scattering of gamma-rays 201
6.5.7 Excitation of isomeric states 201
6.5.8 Examples 202
6.6 Typical applications 203
6.6.1 Biological samples 203
6.6.2 Semi-conductor system analysis 203
6.6.3 Applications to metallurgy 206
6.6.4 Stoichiometry determination of surface layers 208
6.6.5 Proton microbeams 208
6.6.6 Recent developments 210
