N. CABIBBO - Preface . . . . . pag. XI

Gruppo fotografico dei partecipanti al Corso . . . . . fuori testo

## P. HANSEN - Results from the UA1 and UA2 experiments

1. Introduction . . . . .	»	1
2. The UA1 and UA2 detectors . . . . .	»	1
3. Jets and QCD . . . . .	»	2
3'1. Two-jet dominance . . . . .	»	2
3'2. Two-jet transverse momentum . . . . .	»	3
3'3. Two-jet angular distribution . . . . .	»	3
3'4. Structure functions and jet cross-section . . . . .	»	4
3'4. Two-jet mass distribution . . . . .	»	6
3'6. Jet fragmentation . . . . .	»	7
4. W, Z and the standard model . . . . .	»	8
4'1. W production cross-section . . . . .	»	8
4'2. W momentum distribution . . . . .	»	9
4'3. W decay asymmetry . . . . .	»	10
4'4. Z mass and the standard model . . . . .	»	10
4'5. Z width and the number of neutrinos . . . . .	»	12
4'6. Search for $W \rightarrow t + \bar{b}$ . . . . .	»	13
5. Exotic phenomena . . . . .	»	14
5'1. Radiative Z decays . . . . .	»	14
5'2. Monojets . . . . .	»	15
5'3. High- $p_T$ W's . . . . .	»	16

## G. MARTINELLI - Experimental test and theoretical predictions for electroweak processes.

1. Introduction . . . . .	»	19
2. The standard model . . . . .	»	19

3.	Low-energy experimental tests of the standard model . . .	pag. 22
3'1.	Leptonic processes . . . . .	» 22
3'2.	Lepton-hadron reactions . . . . .	» 26
4.	Radiative corrections to low-energy processes . . . . .	» 32
4'1.	Renormalization group applied to the effective weak Hamiltonians . . . . .	» 33
4'2.	Corrections to the evaluation of $R_{\nu\bar{\nu}}$ . . . . .	» 34
5.	Measurements of the W and $Z^0$ masses at the SPS collider and comparison with theoretical predictions. . . . .	» 39

### R. RÜCKL – Weak decays of heavy quark states.

1.	Introduction . . . . .	» 43
2.	The effective weak Hamiltonian . . . . .	» 44
3.	Inclusive decays: the spectator model . . . . .	» 50
3'1.	B-decays . . . . .	» 53
3'2.	D, F decays. . . . .	» 56
4.	Nonasymptotic effects. . . . .	» 58
4'1.	Interference effects in charmed-meson decays. . . . .	» 58
4'2.	Annihilation processes in charmed-meson decays . . . . .	» 59
4'3.	Inclusive charmed-baryon decays . . . . .	» 61
4'4.	Inclusive bottom decays . . . . .	» 63
5.	Two-body decays . . . . .	» 64
6.	Conclusions . . . . .	» 68

### R. PETRONZIO – Compositeness.

1.	Introduction . . . . .	» 76
2.	Composite Higgs . . . . .	» 78
3.	Composite W, Z . . . . .	» 84
4.	Composite fermions . . . . .	» 92
5.	Phenomenology. . . . .	» 98
6.	Concluding remarks . . . . .	» 103

### W. BUCHMÜLLER – Some aspects of supersymmetric composite models of quarks and leptons.

1.	Are quarks and leptons composite? . . . . .	» 105
2.	Quasi-Goldstone fermions . . . . .	» 106
3.	The coset space $U_6/SU_2 \times U_4$ . . . . .	» 109
4.	A $U_6$ model . . . . .	» 112
5.	Towards a realistic preon model . . . . .	» 117

## M. RONCADELLI – Neutrino masses 1984.

Introduction . . . . .	pag. 121
1. Generalities on fermion masses. . . . .	» 122
2. Varieties of neutrino masses. . . . .	» 124
3. A glimpse to experiment . . . . .	» 128
4. A concrete proposal . . . . .	» 130
Appendix . . . . .	» 132

## J. R. PRIMACK – Dark matter, galaxies and large-scale structure in the Universe.

1. Matter. . . . .	» 140
1'1. Sizes . . . . .	» 140
1'2. Galaxies . . . . .	» 141
1'3. Groups and clusters . . . . .	» 152
1'4. Superclusters and voids . . . . .	» 157
2. Gravity . . . . .	» 161
2'1. Cosmology . . . . .	» 161
2'2. General relativity . . . . .	» 163
2'3. Friedmann universes . . . . .	» 166
2'4. Comparison with observations. . . . .	» 169
2'5. Growth and collapse of fluctuations . . . . .	» 177
2'6. Inflation and the origin of fluctuations . . . . .	» 186
2'7. Is the gravitational force $\propto r^{-1}$ at large $r$ ? . . . . .	» 190
3. Dark matter . . . . .	» 192
3'1. The hot big bang . . . . .	» 192
3'2. The dark matter is probably not baryonic . . . . .	» 194
3'3. Three types of DM particles: hot, warm and cold . . . . .	» 200
3'4. Galaxy formation with hot DM . . . . .	» 200
3'5. Galaxy formation with warm DM . . . . .	» 207
4. Cold dark matter. . . . .	» 210
4'1. Cold-DM candidates . . . . .	» 211
4'2. Galaxy and cluster formation with cold DM . . . . .	» 214
4'3. $N$ -body simulations of large-scale structure. . . . .	» 223
4'4. Summary and prospect. . . . .	» 228

## S. FERRARA – Supersymmetry and supergravity.

1. Introduction . . . . .	» 242
2. The challenge of supersymmetry . . . . .	» 245
3. The $N = 1$ supergravity theory . . . . .	» 250
4. Tensor calculus for $N = 1$ supergravity. . . . .	» 254
5. Manifestly invariant actions and transformation laws . . . . .	» 262
6. Final form of the Lagrangian, transformation laws and gauged $R$ -symmetry . . . . .	» 269
7. The super-Higgs effect in $N = 1$ supergravity . . . . .	» 276

A. SAGNOTTI – Ultraviolet divergences and supersymmetric theories.

1. Introduction and survey . . . . .	pag. 280
2. Superspace, superfields and the superspace power counting . . . . .	» 288
3. The breakdown of the power counting . . . . .	» 300
4. Discussion . . . . .	» 309
Appendix . . . . .	» 310

J. B. KOGUT – From asymptotic freedom to fermion computer simulations: lectures in lattice gauge theory.

Introductory remarks . . . . .	» 315
1. Field theory, statistical mechanics and the transfer matrix . . . . .	» 315
2. Lattice gauge theory . . . . .	» 322
3. Weak-coupling perturbation theory, asymptotic freedom, the renormalization group and continuum limits . . . . .	» 329
4. Topological excitations in spin and gauge theories . . . . .	» 340
5. Hamiltonian lattice gauge theory, flux tube dynamics and continuum string models . . . . .	» 353
6. Lattice fermions . . . . .	» 365
7. Fermion computational methods . . . . .	» 379

F. KARSCH – The deconfinement transition in finite-temperature lattice gauge theory.

1. Introduction . . . . .	» 389
2. Thermodynamics of $SU_N$ gauge theories . . . . .	» 390
3. The $SU_N$ deconfinement transition . . . . .	» 393
3'1. The order of the deconfinement transition . . . . .	» 393
3'2. Scaling properties of thermodynamic quantities . . . . .	» 397
4. Deconfinement in the presence of virtual quarks . . . . .	» 398
5. Conclusions . . . . .	» 401

G. PARISI – Spin glasses.

1. Introduction . . . . .	» 404
2. Spin glasses . . . . .	» 404
3. The Sherrington-Kirkpatrick model . . . . .	» 409
4. The solution . . . . .	» 412
5. The physical interpretation . . . . .	» 416

A. E. TERRANO - Computers and theoretical physics.

1. The architecture of conventional computers . . . . .	pag. 422
2. Special-purpose machine design . . . . .	» 428
3. Elements of modern programming . . . . .	» 435
4. Algebraic and interactive programs. . . . .	» 443
Appendix . . . . .	» 449

G. CHARPAK - Selected topics in detector physics.

1. High-accuracy detectors . . . . .	» 456
1'1. Bubble chambers . . . . .	» 457
1'2. Streamer chambers. . . . .	» 457
1'3. MWPC, drift chambers and solid-state detectors . . . . .	» 459
2. Calorimetry . . . . .	» 462
2'1. The various calorimeters . . . . .	» 462
2'2. Liquid ionization detectors (LIDs) at room temperature . . . . .	» 463
2'3. Liquid photocathodes and the coupling of BaF <sub>2</sub> to wire chambers . . . . .	» 465
2'4. The high-density projection chamber . . . . .	» 467
3. Progress in particle identification . . . . .	» 467
4. Conclusion . . . . .	» 468

K. JOHNSEN - Introduction to accelerator physics.

1. Introduction . . . . .	» 470
2. Short description of a few circular accelerators . . . . .	» 471
2'1. The cyclotron . . . . .	» 471
2'2. The betatron . . . . .	» 473
2'3. The synchrotron . . . . .	» 473
2'4. Collider beams. . . . .	» 474
3. Transverse motion in weak-focusing accelerators . . . . .	» 476
3'1. The radial motion . . . . .	» 476
3'2. The vertical motion . . . . .	» 478
3'3. Solutions . . . . .	» 478
3'4. Stability . . . . .	» 478
3'5. Acceptance/emittance. . . . .	» 479
3'6. Momentum compaction. . . . .	» 481
3'7. Summary of the important concepts introduced so far . . . . .	» 482
4. Introduction to alternating-gradient focusing . . . . .	» 482
4'1. A segment of a magnet as a focusing element . . . . .	» 482
4'1.1. Point lens . . . . .	» 484
4'1.2. Drift length . . . . .	» 484
4'1.3. The relation between vertical and horizontal focusing of an element with high field gradient . . . . .	» 484

4'2.	Doublet . . . . .	pag.	485
4'3.	Simple description of an AG accelerator . . . . .	»	486
4'4.	Stability criterion . . . . .	»	486
4'5.	Simple example of an AG system . . . . .	»	487
4'6.	Comments on the elements of the transfer matrix over a period of an AG structure . . . . .	»	490
5.	Longitudinal particle motion . . . . .	»	491
5'1.	Travelling-wave representation of the accelerating field . . . . .	»	492
5'2.	The equations for the longitudinal motion . . . . .	»	493
5'3.	Stability. Transition energy . . . . .	»	494
5'4.	The adiabatic solution . . . . .	»	496
6.	Representative examples of accelerator systems for hadrons . . . . .	»	497
7.	Some special features of electron machines . . . . .	»	498
7'1.	Radiated power and associated losses . . . . .	»	499
7'2.	Radiation damping . . . . .	»	500
7'2.1.	The vertical betatron oscillations . . . . .	»	500
7'2.2.	The horizontal betatron oscillation . . . . .	»	501
7'2.3.	Longitudinal oscillations . . . . .	»	501
7'2.4.	The relation between the three partition numbers $J$ . . . . .	»	502
7'2.5.	Summary of the differences between electron and proton machines . . . . .	»	502
8.	Prospects for the future . . . . .	»	502
